(U) **Mission Description:** The Defense Research Sciences program element is budgeted in the Basic Research Budget Activity because it provides the technical foundation for long-term improvements through the discovery of new phenomena and the exploration of the potential of such phenomena for military, national security and commercial applications. It supports the scientific study and experimentation that is the basis for more advanced knowledge and understanding in information, electronic and materials sciences.

(U) The Information Sciences project supports basic scientific study and experimentation in software technology, intelligent systems technology, human-computer interaction technology, and varied aspects of high performance computing.

(U) The Electronic Sciences project explores and demonstrates electronic and optoelectronic devices, circuits, and processing concepts that will provide: (1) new technical options for meeting the information gathering, transmission and processing required to maintain near real-time knowledge of the enemy, and the ability to communicate decisions based on that knowledge to all forces in near-real time; and (2) a substantial increase in performance and cost reduction of military systems providing these capabilities.

(U) The Materials Sciences project is concerned with the development of: high power density/high energy density mobile and portable power sources; forward combat casualty care medical technologies; magneto-resistive materials for use in radiation hardened memories and motion sensors; processing and design approaches for nanoscale and/or biomolecular materials and interfaces; medical pathogen countermeasures; and advanced thermoelectric materials for cooling and power generation.

(U) **Mission Description:** This project supports the scientific study and experimentation that is the basis for more advanced knowledge and understanding in information sciences technology areas such as software foundations and environments, intelligent systems, human computer interface, language technology, microelectronic science, and high performance computing related to long-term national security requirements.

(U) In the area of software technology development, the project objectives are: advanced concept methods and tools to produce high assurance software; language concepts that facilitate the rapid specification and evolution of systems; and techniques to manage shared complex structured data objects in larger heterogeneous, distributed information systems. The intelligent systems technology focus is on advanced techniques for knowledge representation, reasoning, and machine learning, which enables computer understanding of spoken and written language and images. Also included are advanced methods for planning, scheduling, and resource allocation. The focus in the human computer interaction technology area is design methods and enabling technology for more natural interaction between people and computers. Lastly, the high performance computing (HPC) focus is on science-generated concepts and methods for validating and verifying design components, and unique approaches to rapidly develop high performance libraries across multiple HPC architectures.

(U) **Program Accomplishments and Plans:**

(U) **FY 1996 Accomplishments:**

- Developed complex software languages and tools to integrate architecture-level representations of software systems and used these representations for analysis and testing. (\$7.6M)
- Enhanced advanced information processing methods in spoken language understanding, written language understanding and automated planning systems. (\$3.7M)
- Experimentally evaluated tool kits for interactive, dialogue-based human computer interaction. (\$4.2M)
- Refined and began experimental evaluation of design technology to include high performance computational prototyping of systems. (\$1.5M)
- Demonstrated utility of scalable libraries for defense tasking; completed basic research effort in scalable operating systems and runtime services; initiated Quorum architecture definition; and demonstrated adaptive computing systems for defense applications. (\$2.0M)

- Demonstrate the languages & runtime services in defense applications, and complete the scalable software library technology demonstration. (\$\$.9M)

(U) FY 1999 Program:

- Develop algorithms to deal with high noise conditions for speech recognition and then evaluate automatic transcription of conversational speech over phone and battlefield radio with a goal of producing a transcript that is human readable. (\$7.0M)
- Integrate the multi-attributes of performance, realtime and fault-tolerance for Quorum. (\$1.0M)
- Complete this phase of demonstrations, and validations of adaptive computing systems architectures for defense applications. (\$2.0M)
- Complete the design technology demonstration effort. (\$1.9M)
- Continue the demonstration and validation of ULTRASCALE computing technologies and the scalability of these techniques in defense application. (\$6.0)
- Complete validation and demonstrate scalability of languages & runtime services. (\$1.0M)

COST (In Thousands)	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	Cost to Complete	Total Cost
Electronic Sciences ES-01	37,216	51,097	42,004	44,345	33,478	36,533	31,533	37,533	Continuing	Continuing

(U) **Mission Description:** This project seeks to continue the phenomenal progress in microelectronics innovation that has characterized the last decades by exploring and demonstrating electronic and optoelectronic devices, circuits and processing concepts that will: 1) provide new technical options for meeting the information gathering, transmission and processing required to maintain near real-time knowledge of the enemy, and the ability to communicate decisions based on that knowledge to all forces in near real-time, and 2) provide new means for achieving substantial increases in performance and cost reduction of military systems providing these capabilities. Research areas include new electronic and optoelectronic device and circuit concepts, operation of devices at higher frequency and lower power, extension of diode laser operation to new wavelength ranges relevant to military missions, development of uncooled and novel infrared detector materials for night vision and other sensor applications, development of innovative optical and electronic technologies for interconnecting modules in high performance systems, research to realize field portable electronics with reduced power requirements, research addressing affordability and reliability, and research on microelectromechanical systems (MEMS) technology.

(U) **Program Accomplishments and Plans:**(U) **FY 1996 Accomplishments:**

- Continued investigation of revolutionary approaches to electronics enabled by very small scale devices (nanoelectronics) which operate in a regime where physical phenomenon not important in conventional devices dominate. Demonstrated that compound semiconductor nanoelectronic devices integrated with conventional devices results in significant reductions in chip area required for complex logic functions. Demonstrated the extension of nanoelectronic device designs to silicon-based devices, compatible with future integration with conventional silicon circuits. (\$12.3M)
- Demonstrated optical materials and device designs that enable an order of magnitude reduction in threshold current requirements for diode lasers, demonstrated a means for increasing the bandwidth for direct laser modulation by 25%, and demonstrated technology for applying arrays of optical devices for applications in future high-speed, high capacity switching systems. (\$4.4M)
- Demonstrated photonic device applications of non-semiconductor thin films doped with optically active ions and explored material technologies for monolithically integrated optoelectronic components. (\$3.0M)

RDT&E BUDGET ITEM JUSTIFICATION SHEET (R-2 Exhibit)		DATE
APPROPRIATION/BUDGET ACTIVITY RDT&E, Defensewide BA 1 Basic Research	R-1 ITEM NOMENCLATURE Defense Research Sciences, PE 0601101E, Project ES-01	February 1997
<p>• Demonstrated development of high-density integrated electrical/mechanical MEMS along with requisite developments of CAD tools, materials data base, test and characterization methods, and manufacturing processes. (\$6.2M)</p> <p>• Initiated development of uv-blue gallium nitride based LEDs and lasers for high density memory, lightwave countermeasures, convert communications, and warfare. (\$5.5M)</p> <p>• Assessed thermal response characteristics of thin film material for improved sensitivity uncooled infrared detectors. (\$.8M)</p> <p>• Continued low-power electronics program in the area of circuit architecture and power management techniques. Demonstrated Computer Aided Design (CAD) tool for modeling low power circuit designs and estimating circuit static power dissipation. (\$5.0M)</p>		
<p>(U) <u>FY 1997 Program:</u></p> <ul style="list-style-type: none"> • Continue the ultra-electronics program with emphasis on the following thrusts: combined nanoelectronics and conventional electronics, silicon-based nanoelectronics, chemical self-assembly, and molecular beam epitaxy (MBE) process control and other fabrication techniques. (\$11.2M) • Fabricate small (5 x 5) infrared sensitive arrays as verification of material properties. (\$3.2M) • Develop and demonstrate uv pulsed laser diode operation in the gallium nitride system. Identify relationship between defect density and applicability to military applications such as uv solar blind detectors for missile threat warning. (\$7.2M) • Continue low-power electronics program in the areas of circuit architecture and power management techniques. Demonstrate 256 X 256 pixel sensor with on-chip 10-bit Analog to Digital Converter (ADC). Demonstrate strategies for non-disruptive power supply switching for reduced power consumption. (\$5.8M) • Explore Ultra Photonics efforts leading to advances in the state-of-the-art of Photonic Device Technologies which become the basis for next-generation optoelectronic devices. (\$9.0M) • Establish multi-investigator based centers for research focused on the application of optoelectronic technologies that will enhance the performance of future generations of information processing systems. (\$14.7M) 		
<p>(U) <u>FY 1998 Program:</u></p> <ul style="list-style-type: none"> • Optoelectronics - Demonstrate feasibility of using Gallium Nitride detectors as a UV solar-blind detector for missile threat warning and demonstrate UV/blue lasers operating continuous wave for high density memory and chemical/biological detection. (\$10.9M)

February 1997

APPROPRIATION/BUDGET ACTIVITY

RDT&E, Defensewide
BA 1 Basic Research

R-1 ITEM NOMENCLATURE

Defense Research Sciences,
PE 0601101E, Project ES-01

- Infrared Detector Materials - Determine process for low temperature deposition of thin film uncooled materials. (\$3.0M)
- Ultra-Electronics - Demonstrate feasibility of combining a resonant tunneling device (RTD) with conventional devices, silicon based quantum metal oxide semiconductor (MOS) technology, and simple quantum cellular automatic logic circuits using silicon and silicon germanium structures. (\$11.6M)
- Ultra-Photonics- Demonstrate practical means for implementing high speed optical buffer memories and signal address recognition based on coherent all-optical (photon-echo) technology. Demonstrate the utility of low cost silicon electronic devices doped with optically active elements (such as Erbium) for applications that are now the exclusive domain of more expensive compound semiconductor devices or glassy materials. (\$10.6M)
- Low Power Electronics - Complete low-power electronics programs in the areas of circuit architecture and power management techniques. Demonstrate 256 x 256 pixel image sensor with on-chip 10-bit Analog-Digital Converter. (\$5.9M)

(U) FY 1999 Program:

- Infrared Detector Materials - Establish feasibility of new uncooled detector structures, including micromachined arrays, thin film ferroelectrics and bolometric materials. (\$3.0M)
- Ultra Electronics - Demonstrate programmable matched filter operating at gigahertz speed with substantially less power than silicon complementary metal oxide semiconductor (Si CMOS), completely integrated molecular beam epitaxy (MBE) growth system which realizes closed-loop control of atomic layer growth and quantum device structures. (\$4.9M)
- Ultra-Photonics - Identify the device properties limiting performance of vertical cavity lasers and demonstrate methods for controlling their output beam quality. (\$7.7M)
- Advanced Microelectronics - Explore new concepts, directed at demonstrating feasibility of radical device and systems architecture concepts. Of particular emphasis will be device concepts in microelectronics and optoelectronics enabled by technology advances in related areas, particularly those in sub 0.1 micron lithography and mixed-technology integration. (\$13.7M)
- Integrate promising new elements of ultra-electronics, high power electronics, non-volatile memory and Electro-Magnetic Interference (EMI) electronics to address current thrusts in smaller, lighter, more mobile information systems and highest performance components and systems. (\$15.0M)

(U) **Mission Description:** This project is concerned with the development of: high power density/high energy density mobile and portable power sources; forward combat casualty care medical technologies; technologies for defense against biological warfare agents; magneto-resistive materials for use in radiation hardened memories and motion sensors; advanced thermoelectric materials for cooling and power generation; processing and design approaches for nanoscale and/or biomolecular materials and interfaces; and medical pathogen countermeasures.

(U) **Program Accomplishments and Plans:**

(U) **FY 1996 Accomplishments:**

- Electrochemistry. (\$10.3M)
 - Developed and demonstrated a high efficiency fuel reformer for fuel cell applications to process logistic fuel (e.g., DF-2, JP-8).
 - Demonstrated fuel cell operation using either hydrogen or methanol with performance adequate for soldier applications.
 - Tested a novel direct oxidation logistics fuel cell concept.
- Biomedical. (\$1.7M)
 - Exploited technology base developments in microelectronics, sensors, communications, imaging and simulation to enhance far-forward combat casualty care.
 - Developed haptic interface for virtual environments and holographic display for virtual images in simulation.
- Biological Warfare (BW) Defense. (\$3.2M)
 - Continued the development of Up-Converting Phosphor technology and antibody deposition on chips for real-time BW sensing.
 - Demonstrated the feasibility (in the laboratory) of using modified red blood cells to eliminate pathogens from the blood for the purpose of potential defense against biological weapons.
- Magnetic Materials and Devices. (\$1.9M)
 - Demonstrated enhanced magneto-resistance ratio at low magnetic fields for faster response and higher sensitivity of magnetic devices.
 - Evaluated spin transistor and spin tunneling devices for use in sensors and non-volatile memories.

- Brassboard testing of compact, high performance energy sources for portable power applications.
- Demonstrate novel thermoelectric and thermophotovoltaic power generation devices based on advanced materials.
- Nanoscale/Biomolecular Materials. (\$2.0M)
 - Demonstrate the applicability of nanostructural and/or biomolecular materials in defense applications such as armor, high strength fibers, or coatings.
- Pathogen Countermeasures. (\$3.0M)
 - Develop understanding of disease-causing (virulence) factors in pathogens of concern to DoD.
- Thermoelectric Materials. (\$2.0M)
 - Develop thin film cooler utilizing quantum well structures.

Next Generation Internet,
PE 0602110E, R-1 #7

COST (In Thousands)	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	Cost to Complete	Total Cost
Next Generation Internet NGI-01	0	0	40,000	40,000	40,000	0	0	0	0	N/A

(U) **Mission Description:** The Next Generation Internet (NGI) is an Administration initiative that has three goals: (1) connect universities and national laboratories with high speed networks that are 100 - 1000 times faster than today's Internet; (2) promote experimentation with the next generation of networking technologies; and (3) demonstrate new applications that meet important national goals and missions. The principal agencies involved in this initiative are DARPA, NSF, DOE, NIST and NASA. These agencies will share in funding this research and development effort at \$100 million from FY 1998 through FY 2000. The DARPA activity will be aimed at part of the first goal (ultra-high performance connectivity). DARPA will demonstrate end-to-end network connectivity at 1+ gigabits-per-second for 10 of NGI sites and applications. These applications will be the drivers of the properties of very high speed networks to stress the network hardware, software, and products to determine their true characteristics and limitations. The technologies to be addressed include multi-gigabit broadband networks, guaranteed quality of service mechanisms, and integrated network management. These technologies will be demonstrated in a NGI developed testbed environment.

(U) **Program Accomplishments and Plans:**(U) **FY 1996 Accomplishments:** N/A(U) **FY 1997 Program:** N/A(U) **FY 1998 Program:**

- Develop, design and initiate building the NGI testbed. (\$5.0M)
- Create ultra high bandwidth Wavelength Division Multiplier (WDM) connections for Next Generation Internet (NGI) testbed (Supernet). (\$15.0M)
- Define quality of service architecture and implement initial operating system kernel for the Supernet testbed. (\$15.0M)
- Define 10 gigabit-per-second optical switching transmission protocols and network and resource management strategy. (\$5.0M)

(U) **Mission Description:** This project supports the JASONS, an independent group of distinguished scientists and technical researchers that provides analysis of critical National Security issues. JASON membership is carefully balanced to provide a wide spectrum of scientific expertise and technical analysis in theoretical and experimental physics, materials, information sciences, and other allied disciplines. The JASON process ensures senior government leaders have the full range of U.S. academic expertise available on issues critical to National Security involving classified and unclassified information.

(U) **Program Accomplishments and Plans:**

(U) **FY 1996 Accomplishments:**

- Continued studies in: Nuclear and chemical weapons proliferation, precision strike weapons, global surveillance and communications; counter drug surveillance techniques; shallow water ASW; advanced signal processing; and counter terrorism.

(U) **FY 1997 Program:**

- Continue studies in: Counter proliferation of chemical and biological weapons; precision deep strike weapons, battlefield information systems, battlefield planning and control, law enforcement surveillance techniques; land mine detection; advanced sensor technologies; global surveillance and intelligence; and counter terrorism.

(U) **FY 1998 Program:**

- Continue studies of interest to DoD in multiple disciplines such as: Counter proliferation of chemical and biological weapons; precision deep strike weapons, battlefield information systems, battlefield planning and control, land mine detection; advanced sensor technologies; global surveillance and intelligence; and counter terrorism.

(U) **FY 1999 Program:**

- Continue studies of interest to DoD.

(U) **Mission Description:** This project develops new information processing technology concepts that lead to fundamentally new software and intelligent systems capabilities. This will enable advanced information systems to more effectively accomplish decision-making tasks in stressful, time sensitive situations and create efficient software systems supporting computer and software intensive defense systems. Major areas of technical emphasis are: (a) intelligent systems (artificial intelligence) including autonomous systems, image understanding, intelligent integration of information from heterogeneous sources, and interactive problem solving, planning, scheduling, and decision analysis; (b) software development technology including languages, algorithms, data and object bases, domain specific software architectures, software prototype technology, software design tools, software reuse, and advanced software engineering environments; (c) manufacturing automation and design engineering, including the development of advanced software systems which support sharing of engineering knowledge, advanced product and process design representations, integrated product and process design, software tools for design process management, manufacturing process planning, manufacturing process control and demonstrations; (d) Text Video Speech (TVS) technology focusing on the integration and application of emerging language understanding technology for both C4I and Intelligence community needs; and (e) organizing resources to obtain access to multiple systems and decision aids that provide logistical information when and where it is needed.

(U) **Program Accomplishments and Plans:**(U) **FY 1996 Accomplishments:**

- Demonstrated and evaluated advanced reconnaissance, surveillance, and target acquisition algorithms on unmanned ground vehicle; installed baseline RADIUS Site Monitoring System at National Photographic Interpretation Center; delivered first version image understanding environment. (\$10.9M)
- Experimentally evaluated implementations for human-aided machine language translation, document understanding, and robust speech understanding in adverse acoustic conditions. (\$13.4M)
- Experimentally evaluated implementations of real-time planning and control algorithms. (\$1.8M)
- Evaluated knowledge-based planning and decision aids to support the rapid construction of multiple crisis action plans in an operational exercise. (\$9.4M)

APPROPRIATION/BUDGET ACTIVITY RDT&E, Defensewide BA 2 Applied Research	R-1 ITEM NOMENCLATURE Computing Systems and Communications Technology, PE 0602301E, Project ST-11

- Extend Architecture Description Language for complex systems to include performance and context information. (\$5.5M)
- Initial implementation of distributed dynamic language and real-time dynamic language. (\$4.5M)
- Initial web-structure configuration management capability. (\$3.9M)
- Support software initiatives at the NASEC, Johnstown. (\$9.8M)
- Develop new image understanding technologies for image exploitation, automatic population of geospatial databases, and video surveillance and monitoring to enhance battlefield awareness. (\$6.0M)
- Perform university research toward development of automated target recognition technologies that operate effectively under difficult circumstances involving obscuration, camouflage, and urban settings. (\$1.1M)
- Developed and demonstrated, in the Intelligent Integration of Information area, techniques to integrate disparate data sources for logistics planning, command and control, and battlefield awareness. (\$11.3M)
- Developed a library of knowledge base components and a suite of interoperable editing tools to support the creation and maintenance of High Performance Knowledge Bases in battlefield awareness and military command and control. (\$7.8M)
- Develop site-monitoring technology and testbed for evaluating utility of automated tools for image analysts. (\$1.8M)
- Reuse Technology Adoption Program (RTAP). (\$2.5M)

(U) FY 1998 Program:

- Integrate selected RaDEO design computation tools to demonstrate robust multi-disciplinary design. Demonstrate a 5X reduction in early design trade-off time by combining qualitative and quantitative models. (\$5.5M)
- Develop initial prototypes for multi-language text extraction and audio transcription where performance is baselined against that of human operators. (\$6.7M)
- Continue development of human-computer interaction, heterogeneous testbed products and insertion. Test, evaluate and demonstrate enhancements to the developer and user communities. (\$11.4M)
- Develop modular Human Language Technologies to support easy, low-cost, rapid technology transfer and application development for Document Understanding, Machine Translation, and Speech Understanding. (\$5.7M)
- Develop, in the Intelligent Integration of Information area, tools and techniques to enable the rapid construction of information fusion, aggregation, and summarization software to filter, access, and integrate information from 100's of disparate, heterogeneous, distributed data sources. (\$9.5M)

- (U) **Mission Description:** This project develops the computing, networking, and associated software technology base underlying the solutions to computational and information-intensive applications for future defense and federal needs. These technologies lead to successive generations of more secure, higher performance, and more cost-effective scalable systems, associated software technologies, advanced mobile information technology and prototype experimental applications critical to defense operations. The High Performance Computing program is comprised of the following components:
- Global Mobile Information Systems effort deals with the activities required for defense-based mobile systems, including modal architectures, adaptive extensions, changing resources and robust mobile services.
 - The Systems Environments component develops scalable software which is tailored toward easing the use of systems by application programmers. This includes languages, run-time services, scalable software library technologies, and experimental applications.
 - The Networking component develops high performance networking technologies and associated network management capabilities. Research is coordinated with network technology and Service deployments made by DoD, NASA, and other federal agencies.
 - The Scalable Systems and Software component develops software and hardware technologies leading to a secure scalable computing and communications technology base for systems configured over a wide performance range, from mobile handheld devices to desktop workstations to the largest-scale, highest performance systems.
 - The Microsystems component develops design tools, environments, and design infrastructure to support the research and development of advanced scalable parallel computing components and embedded computing systems. Microsystems is the incubator and delivery mechanism of future generation defense advanced information systems components. Microsystems is the critical bridge that leverages other DARPA technology in low-power processes, advanced packaging, materials, and electronic componentry to develop the critical architecture and building blocks of the most advanced defense computing and communication systems.
 - Defense Technology Integration and Infrastructure combines state-of-the-art computing and information technologies focused on critical defense applications. These include developing embeddable systems based upon scalable technologies, and projects which accelerate technology transition of advanced research to intelligence, command and control, and other major DARPA and DoD programs. Technologies addressed include

- information management, integration of systems, real-time, multimedia collaboration and visualization and application adaptivity.

(U) Each of the above components of this program will integrate capabilities developed under the Information Survivability initiative (Project ST-24) to satisfy defense requirements for secure systems.

(U) Program Accomplishments and Plans:

(U) FY 1996 Accomplishments:

- Global Mobile Information Systems. (\$14.7M)
 - Developed initial prototype of adaptive extensions; and untethered node hardware/software architectures.
 - Demonstrated design environments supporting simulation and synthesis of wireless systems.
 - Completed the experimental evaluation of the integration of multiple advanced intelligent systems.
- Systems Environments. (\$23.0M)
 - Evaluated first generation of fully scalable operating system software and programming environments on small-scale versions of teraops computing systems.
 - Defined second generation of High Performance Fortran with extensions for task parallelism and support for scalable Input/Output (I/O).
 - Demonstrated extensions of portable scalable libraries to incorporate object-oriented technology and a broader set of applications.
 - Enhanced and experimentally evaluated advanced software environment that supports composition tools.
- Networking. (\$29.9M)
 - Prototyped networks at greater than 40-gigabit-per-second speed using optical technologies; experimentally validated scalable network protocols at the higher speeds; and integrated secure nomadic computing architecture into existing wide area networks.
 - Deployed reference implementation of protocol-independent, multicast-capable infrastructure as basis for development of advanced services.
 - Demonstrated robust and secure network-level infrastructure protocols to include directory services and resource allocation; and technology for autonomous, node-level network management.
- Scalable Systems and Software. (\$37.0M)
 - Demonstrated user-extensible microkernel operating system technology, integrating compiler and run-time

RDT&E BUDGET ITEM JUSTIFICATION SHEET (R-2 Exhibit)

APPROPRIATION/BUDGET ACTIVITY RDT&E, Defensewide BA 2 Applied Research	R-1 ITEM NOMENCLATURE Computing Systems and Communications Technology, PE 0602301E, Project ST-19

- support services; computing node architectures that dramatically increase internal memory and communications bandwidths; and I/O enhancements to a scalable operating system that overcomes identified bottlenecks leading to significant improvements in throughput.
- Microsystems. (\$33.9M)
 - Performed early demonstration of parallel, fully-hierarchical Automatic Test Generation for both combinational and sequential circuits.
 - Demonstrated fault-tolerant and reliability design tools supporting large-scale HPC systems developments; distributed computing architectures based on low-cost, low-latency switching technology; and integrated module-level synthesis capability.
 - Prototyped emulation-enhanced system simulation capabilities for microsystems design.
 - Developed highest performance open interconnect component for embedded defense systems, future demos in various systems, missiles and satellites.
 - Designed message-passing/shared-memory hybrid architecture protocol accelerator component.
 - Defense Technology Integration and Infrastructure. (\$43.1M)
 - Developed and provided experimental testbed services employing advanced high performance computing technologies for defense users; and prototype distributed, object-oriented architecture for scalable, interoperable, multimedia digital library repositories.
 - Prototyped embedded computing system modules with scalability concepts containing memory hierarchy and power on a single unit of replication.
 - Performed integration tests in key defense applications such as advanced distributed simulation, advanced distributed collaboration, advanced communications and control, and advanced human computer interfaces.
 - Demonstrated first fine-grained high performance embedded and scalable computer system; graphical program environments for embedded systems; prototype toolkits supporting development of applications adaptive to changes in the computing and communication environment; and prototype of information services through a testbed incorporating information management and secure transactions.
 - Demonstrated the integration of multiple real-time systems in a semi-autonomous ground vehicle.
 - Metacomputers. (\$7.7M)
 - Established a metacomputing center testbed in the National Capital Region.

- * Test subsystem in a testbed and demonstrate subsystems scalability in a defense application.
- Active Networks.
 - * Implement prototype of Enhanced Networking Services utilizing composable modules.
 - * Complete composite protocol prototype implementation of execution environment; of fast compiler for SmartPacket Methods; and of basic switch functions.
 - * Initiate operation of wide area Active Network on composite prototype platforms.
- Scalable Systems and Software. (\$40.9M)
 - Scalable Computing.
 - * Demonstrate highly efficient, parallel nodes; auto-parallelization performance of file I/O from Scalable I/O Consortium; first node-level performance of ultra-low-power systems; performance of novel backplane networks supporting security; and hardware-accelerated, distributed, shared-memory performance on workstation clusters.
 - Ultrascale Computing.
 - * Design, model, and assess quantum-to-Si hardware and software interface; and language for expressing amorphous algorithmic computations.
 - * Develop tools and mechanisms to build bioelectronic systems.
 - * Demonstrate 256-component addressed array of molecular computational mechanisms; and evaluate surface patterning mechanisms for culturing neural components on silicon.
- QUORUM.
 - * Develop quality-of-service negotiation protocols for performance architecture attributes; and adaptive resource discovery protocols.
 - * Demonstrate order of magnitude improvement in operating systems/network interface of translucent system; and LAN-based quality-of-service performance assurance for Quorum Prototype #1.
- Microsystems. (\$28.7M)
 - Microsystems Design.
 - * Develop formal complex system design semantics for common intermediate format and extend arithmetic verification of complex system design to floating point.
 - * Verify complex system, in-order execution superscalar processors and automate complex system error modeling and test generation.
 - * Demonstrate scalability beyond 128 nodes of parallel design environment; scalable, parallel-processing; and symbolic simulation linked with hardware emulation for complex system design.

(U) **Mission Description:** Software is key to meeting DoD's increasing demand for quality, affordability, and timeliness of national defense systems. There is a critical need to rapidly transition state-of-art technology and best practices to improve the acquisition, engineering, fielding, and evolution of software-intensive DoD systems. This project funds the technology transition activities of the Software Engineering Institute (SEI) at Carnegie Mellon University. The SEI is a DARPA sponsored Federally Funded Research and Development Center (FFRDC). It was established in 1984 as part of the DoD's software initiative to identify high leverage technologies and practices and to establish transition mechanisms that enable technology exploitation by both "in-house" government facilities and the industrial base where the bulk of defense software is produced. The Institute works across government, industry, and academia to: (1) improve current software engineering practice for DoD systems; (2) provide value-added transition of technology to practice; and (3) evaluate and calibrate emerging technologies to determine their potential for improving the evolution of software-intensive DoD systems.

(U) The SEI enables the exploitation of emerging software technology by bringing engineering discipline to software development and evolution. The SEI focuses on software technology areas judged to be of the highest payoff in meeting defense needs. Current focus areas include Trusted Systems and Information Warfare, Software Acquisition Risk Management, Architecture-Centered Software Engineering, and Software Processes and Process Improvement.

(U) **Program Accomplishments and Plans:**(U) **FY 1996 Accomplishments:**

- Improved practice of software engineering for DoD systems -- validation of Capability Maturity Model (CMM) as a guide to effective software process; education in Personal Software Process to improve performance of individual engineers; a repository of software risk management experience; and creating/modifying guides to the current practice of software reengineering; guidelines for adoption of Computer Aided Software Process (CASE) tools and case studies of product line engineering. (\$8.0M)
- Evaluated software technology to facilitate transition -- guide to software architecture description languages; approaches to architecture evaluation and comparison; lessons learned in software technology evaluation; and software process measurement guidebook. (\$7.0M)

- Trusted software and information warfare -- Establish intelligent incident response infrastructure that maintains awareness of current threats and solutions. Provide "immunization" of systems to attack (or other threats) by categorizing the root causes for network security flaws and developing mechanisms to correct these causes. Investigate technology for early analysis of system attributes pertaining to trust based on architectural descriptions of the system. Define and document administrative practices for operating a trustworthy network and distribute on interactive media. (\$12.1M)

(U) FY 1999 Program:

- Investigate/develop capabilities for rapid and inexpensive creation of Very High Level Languages (VHLLs) and code generators to attain breakthrough improvements in software productivity and quality. (\$3.0M)
- Develop and distribute methods and tools to support prediction of key system properties during system development and preservation during system evolution. (\$5.2M)
- Provide tools and techniques to enable rapid adaptation and reconfiguration of systems to ensure survivability in the face of attack. (\$3.0M)
- Define effective means for interoperation/integration of heterogeneous system components that are generated from architectural descriptions and account for differences in fidelity and semantics as well as protocols. (\$5.0M)
- Establish analysis and test infrastructure for assessing the survivability of software systems that include Commercial Off The Shelf (COTS) products. (\$4.0M)

COST (In Millions)	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	Cost to Complete	Total Cost	
Information Survivability ST-24	26,134	34,653	45,812	46,113	50,115	55,046	60,654	65,000	Continuing	Continuing	

(U) **Mission Description:** This project is developing the technology required to protect DoD's mission-critical information systems against attack upon or through the supporting infrastructure. These technologies will lead to generations of stronger protection, higher performance, and more cost-effective security solutions scalable to several thousand sites and to high performance computing technologies. Technologies developed under this project will be exploited in High Performance Computing (ST-19) and other defense programs to satisfy defense requirements for secure and survivable systems. This program is an expansion of investments in information security made previously in High Performance Computing.

(U) Information Survivability focuses on early prototypes of software and hardware technologies leading to scalable protection for large-scale, heterogeneous systems usable over a wide range of performance in diverse threat environments. High confidence networking technologies will be developed consisting of security mechanisms and value-added security services for integration into network technologies. High confidence computing systems will be developed that provide modular security services and mechanisms, provide high reliability for distributed computations, and allow geographically-separated parts of an organization to interact as if they shared a common security perimeter. This also includes secure and fault-tolerant operating systems, firewalls, and system management tools. Assurance and integration tools will aid the development of high assurance and trusted systems that add expression of modular system structures, networking, and other distributed-system protocols and the ability to reason about their security properties.

(U) Survivability technologies will be developed to mitigate national and defense computing infrastructure vulnerabilities that could be exploited by an information warfare enemy. Intrusion-detection systems will allow attacks on the defense infrastructure to be detected, the damage to be assessed, and appropriate response to be taken. Technologies will be developed to allow crisis-mode operation of critical infrastructure components. Robust networking protocols will be designed to facilitate continuous operations in hostile environments.

Computing Systems and Communications Technology,
PE 0602301E, Project ST-24

- Demonstrate technology for detecting the presence of malicious intruders through statistical profiling and behavioral models of benign and malicious users.
- Develop microsystems design. (\$2.6M)

(U) FY 1998 Program:

- High Confidence Networking. (\$9.0M)
 - Release reference implementation of secure Border Gateway Protocol routing protocol.
 - Release library of application embeddable network security services.
 - Demonstrate secure signaling and call set-up for Asynchronous Transfer Mode networks.
- High-Confidence Computing. (\$12.9M)
 - Commercial certified B3 workstation featuring trusted computing base available.
 - Prototype Common Object Request and Broker (CORBA)-compliant Domain and Type Enforcement for secure location interoperability.
 - Trusted, high assurance operating system kernel extensions.
- Demonstrate integrated security support in prototype extensible operating system.
 - Assurance and Integration. (\$8.4M)
- Complete design tools for inferring system-level properties in composed systems.
 - Complete tools for secure refinement of secure software architectures.
- Survivability for Large Scale Systems. (\$15.5M)
 - Demonstrate a primitive survivable "immune system" for responding to attacks and intrusions.
 - Demonstrate resource allocation mechanisms for adaptive system of systems.

(U) FY 1999 Program:

- High Confidence Networking. (\$12.0M)
 - Demonstrate suite of secure reliable distributed applications over mobile and wireless networks.
- High-Confidence Computing. (\$12.1M)
 - Demonstrate techniques for general pairwise tradeoffs among fault-tolerance, real-time operations and security.
- Assurance and Integration. (\$7.0M)
 - Characterize a set of security and fault-tolerance techniques by strength and cost, for plug-and-play wrappers.
 - Demonstrate integration of security composition techniques into software engineering tools.

Biological Warfare Defense
PE 0602383E, R-1 #14

COST (In Thousands)	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	Cost to Complete	Total Cost
Biological Warfare Defense Program BW-01	0*	0*	61,600	61,800	50,500	44,000	45,648	40,000	Continuing	Continuing

* The program has received approval as a stand alone effort in the FY 1997 DoD Authorization Act and leverages activities previously funded in PE 0602712E, Project MPT-01 in FY 1996 and PEs 0601384BP, 0602384BP, and 0603384BP in FY 1997.

(U) **Mission Description:** This program element funds projects supporting revolutionary new approaches to biological warfare (BW) defense. Today, there is a tremendous mismatch between the magnitude of the biological warfare threat and the Department's ability to adequately respond. The widespread availability of bacterial, viral, and toxin stocks; minimal developmental cost and scientific expertise required; and abundance of weaponization potential comprise a sinister threat. The single largest concern, however, is from the exploitation of modern genetic engineering by adversaries to synthesize "super pathogens." Recent dramatic developments in biotechnology, which this program will leverage, promise to eliminate this mismatch.

(U) Efforts to counter the BW threat include developing barriers to block entry of pathogens into the human body, pathogen countermeasures to stop pathogen virulence and to modulate host immune response, medical diagnostics for the most virulent pathogens and their molecular mechanisms, biological and chemically-specific detectors, and informatics tools. Program development strategies will include collaborations with the pharmaceutical, biotechnology, government, and academic centers of excellence.

(U) Pathogen countermeasures to be developed include: (1) multi-agent therapeutics against known, specific agents and (2) therapeutics against virulence pathways shared by broad classes of pathogens. Specific approaches include modified red blood cells to sequester and destroy pathogens, modified stem cells to detect pathogens and produce appropriate therapeutics within the body, identification of virulence mechanisms shared by pathogens, development of therapeutics targeting these mechanisms, and efficacy testing in cell cultures and animals.

(U) The ability to detect biological warfare agents on the battlefield in real time with no false alarms is a crucial requirement. To address this requirement, the program will create more efficient and effective miniature sampling devices that concentrate contaminated air and enhance the ability to capture biological warfare agents. Second, the program will develop a new range of antibodies or design small molecules to bind specific agents (to replace the lower affinity antibodies currently used). In order to detect that the binding of an agent has occurred, the event must be "magnified." Traditionally this is done by tagging the antibody molecule with a fluorescent probe.

RDT&E BUDGET ITEM JUSTIFICATION SHEET (R-2 Exhibit)		DATE
APPROPRIATION/BUDGET ACTIVITY RDT&E, Defensewide BA 2 Applied Research		February 1997
R-1 ITEM NOMENCLATURE Biological Warfare Defense PE 0602383E, Project BW-01		
<p>This program will replace the noise-plagued fluorescent tags with Up-Converting Phosphors and magnetic beads with the sensitivity to detect a single binding event, minimizing the size of the sample required, saving time, and decreasing the number of false positive alarms. Finally, the use of fluids as a requirement for biological agent detection will be eliminated and replaced by a miniaturized (shoe box size) time-of-flight mass spectrometer.</p> <p>(U) Mission effectiveness requires rapid, correct medical responses to biological weapon threats or attacks. A portion of this project will provide comprehensive protocols to protect or treat combatants by using current and emerging biological countermeasures. It will provide accelerated situational awareness for biological warfare events by detecting exposure to agents through an analysis of casualty electronic theater medical records and will locate and determine the most effective logistical support for providing appropriate treatment and pathogen-specific resources required to mitigate effects of the attack.</p> <p>(U) <u>Program Accomplishments and Plans:</u></p> <p>(U) <u>FY 1996 Accomplishments:</u> N/A</p> <p>(U) <u>FY 1997 Program:</u> N/A</p> <p>(U) <u>FY 1998 Program:</u></p> <ul style="list-style-type: none"> • Pathogen Countermeasures. (\$43.1M) <ul style="list-style-type: none"> - Optimize the detection of specific pathogens by stem cells (in cell culture). - Determine the impact of modified red blood cells on vascular and immune systems. - Define animal models in which to test the efficacy of modified red blood cells to defend against pathogens. - Develop enzymes or other active molecules which can be attached to the surface of red blood cells to detect and destroy pathogens. - Establish a portfolio of strategies to: <ul style="list-style-type: none"> * inhibit the expression of disease-causing (virulence) factors by pathogens. * disrupt the disease-causing (virulence) communications between pathogens. * modulate the body's response to the presence of a pathogen. * assess feasibility of novel polymeric materials to protect against pathogen exposure. - Assess the feasibility of an array based instrument (or other novel technologies) for multi-agent pathogen diagnosis in medical samples.

APPROPRIATION/BUDGET ACTIVITY	RDT&E, Defensewide BA 2 Applied Research

- Sensors. (\$10.0M)
 - Develop hierarchical database of mass signatures for use in detecting selected bacteria with a mass spectrometer.
 - Investigate methods for determining biological warfare agent bacterial and viral viability (agent live or dead).
 - Design a gridded array detector for use with Up-Converting Phosphors.
 - Demonstrate the feasibility of using giant magnetoresistance for the detection of magnetic bead-tagged pathogens.
 - Fabricate and test a wick device, an integral sample pump, and a reagent reservoir system suitable for use in a handheld Up-Converting Phosphor detector.
 - Continue development of a portfolio of air sampling devices for airborne biological materials.
- Informatics. (\$8.5M)
 - Demonstrate a biological warfare Anchor Desk that provides agent-specific biological warfare (BW) situational awareness, decision and execution support with linkages to the Logistics Anchor Desk (LAD) for BW-specific logistical information.
 - Develop agent-specific "software antibodies" for detection, protection, and treatment directives to medical personnel for BW threats that will decrease response time.
 - Develop quantitative measures of operational assessment using Medical Readiness Indicators (metrics based indicators of individual and unit level readiness) and realistic BW training algorithms to improve BW medical responses.

(U) FY 1999 Program:

- Pathogen Countermeasures. (\$46.3M)
 - Develop a modified stem cell which can both detect and produce a prophylactic/therapeutic response to a pathogen (in cell culture).
 - Define animal models in which to test the efficacy of modified stem cells to prevent disease.
 - Determine in-vitro toxicity of modified stem cell-produced therapeutics.
 - Demonstrate in laboratory animals the efficacy of modified red blood cells to eliminate pathogens from the blood for the purpose of potential defense against biological warfare agents.
 - Determine pathogen detection and elimination efficacy for modified red blood cells with enzymes or other active molecules attached to their surfaces.
 - Demonstrate selected strategies (in cell culture) to:
 - * inhibit the expression of disease-causing (virulence) factors by pathogens.
 - * disrupt the disease-causing (virulence) communications between pathogens.

(U) **Mission Description:** This program element is budgeted in the Applied Research Budget Activity because it supports the advancement of concepts and technologies to enhance the next generation of tactical systems. The Tactical Technology program element funds a number of projects in the areas of Naval Warfare, Advanced Land Systems, Advanced Tactical, Aeronautics, and Advanced Logistics technologies.

(U) The Naval Warfare Technology project is focusing on: Simulation Based Design (SBD) and Command, Control, Communications and Intelligence/Synthetic Environments (C3I/SE). The Simulation Based Design program will provide the tools required to integrate cost, performance and manufacturing considerations throughout the design process. The SBD program is developing and demonstrating a prototype infrastructure that will enable a significant positive change in the acquisition process for large, complex warfighting systems utilizing virtual prototypes in synthetic environments. In the C3I/SE program, advanced information technologies are being integrated into advanced prototype

RDT&E BUDGET ITEM JUSTIFICATION SHEET (R-2 Exhibit)		DATE
APPROPRIATION/BUDGET ACTIVITY RDT&E, Defensewide BA 2 Applied Research		February 1997
R-1 ITEM NOMENCLATURE Tactical Technology, PE 0602702E		

systems to provide improved battlefield awareness and dominance to mobile command centers in the field. In FY 1997, the effort was expanded to include the Collaborative Crisis Understanding program. Also funded in this project is the 3-D high-resolution Digital Terrain Mapping effort.

(U) The Advanced Land Systems Technology project is developing technologies for contingency missions and military Operations-Other-Than-War (OOTW) to make U.S. combat forces more deployable, effective, survivable, and affordable. The SLID program will develop and test a system for providing protection against missiles and projectiles with explosive warheads. The Foreign Cooperative Demonstration program will concentrate on enhancing the survivability of armored vehicles. The Magic Vision program will generate obscurant smoke to deny adversary forces the ability to see on the battlefield while providing our forces with image sensors to see through smoke. The Advanced Fire Support Systems program will provide rapid response and lethality associated with gun and missile artillery, thereby increasing survivability, yet it will require less personnel and logistical support. The Unexploded Ordnance Detection program will develop sensors for the chemically specific detection of explosives or other chemicals, comparable to the effectiveness of canine olfaction detection.

(U) The Advanced Tactical Technology project is exploring the application of compact lasers; compact high-density holographic data storage and high performance computational algorithms to enhance performance of radars, sensors, communications, and electronic warfare and target recognition and tracking systems. The technologies under development will improve passive infrared signature suppression, tactical landing systems, miniature air-launched decoy systems, and affordable rapid response missile demonstration.

(U) The Aeronautics Technology project will develop and demonstrate a new family of Micro-Aerial Vehicles (MAVs). The MAVs will be an order of magnitude smaller than any operational UAV and will be useful in a wide variety of military missions from covert imaging and chemical/biological agent detection to communication enhancement. The feasibility of developing a family of Unmanned Tactical Aircraft (UTAs) will be investigated and demonstration of a Urban Combat Vehicle (UCV) will be demonstrated. This UCV, a small, inexpensive aircraft, will be able to proceed to the target area, identify a potential target and release a loitering weapon or weapons with the assistance of a ground-based controller.

(U) The Advanced Logistics project is investigating and demonstrating technologies that will make a fundamental difference in transportation and logistics. The program will define, develop, and demonstrate fundamental enabling technologies that will permit forces and sustainment materiel to be deployed, tracked, refurbished, sustained, and redeployed more effectively and efficiently than before.

DATE		February 1997
APPROPRIATION/BUDGET ACTIVITY RDT&E, Defensewide BA 2 Applied Research	R-1 ITEM NOMENCLATURE Tactical Technology, PE 0602702E	

(U) The Joint Logistics Advanced Concepts Technology Demonstration (ACTD) is a program that will provide hands-on demonstrations of existing and evolving logistics tools to facilitate their introduction into the service logistics community. Initial demonstrations will focus on near-term capabilities that can operate within the Global Combat Support System. Follow-on demonstrations will integrate enhanced asset tracking and transportation models with advanced Command and Control systems under development (i.e. the Battlefield Awareness and Data Dissemination ACTD).

Tactical Technology, PE 0602702E

COST (In Thousands)	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	Cost to Complete	Total Cost
Naval Warfare Technology TT-03	38,464	31,714	10,222	28,296	49,553	59,172	59,172	60,172	Continuing	Continuing

(U) **Mission Description:** The Naval Warfare Technology project develops advanced technologies for application to a broad range of naval requirements. The enabling technologies include: Virtual prototyping and advanced modeling to radically change the DoD acquisition process through integrated product and process design; integrated ship sensor, weapons and platform technologies to demonstrate the feasibility of reduced ship manning; techniques that will reduce acquisition costs through greater reliance on commercially available components for quiet electric ship propulsion, and corrosion-resistant composite materials and coatings; all weather interferometric sensors for precision 3-D characterization and surveillance of littoral environment for smart Naval Fire Support (NFS) weapons; and Command, Control, Communications, and Intelligence/Synthetic Environments (C3I/SE) for littoral warfare.

(U) The Simulation-Based Design (SBD) Program is developing, testing, and transitioning to the military services, a prototype digital knowledge environment for representing physical, mechanical, and operational characteristics of a complex system. Such an environment will enable a significant positive change in the acquisition process for large, complex warfighting systems. SBD will utilize virtual prototypes in synthetic environments to enable effective, integrated product and process development. The program will integrate the technologies of distributed interactive simulation, physics-based modeling, and virtual environments and apply them to the design, acquisition, and life cycle support processes of systems. Complete simulation, from the concept formulation stage through verification of requirements, to design, manufacture, operation, training, and logistics, will be available prior to initiation of construction. Successful development and deployment of SBD will reduce the cost and acquisition time for DoD systems. SBD will be applicable to all subsystems, from mechanical to large scale electronic, within an overall system and it will enable cost savings by reducing the need for expensive physical mockups and by eliminating many of the manufacturing inefficiencies caused by inadequate design. Overall product quality and capabilities will be enhanced by the timely insertion of the latest technological advances into designs as they progress through the shortened acquisition cycle. SBD will be applicable to a broad range of system domains including land vehicles, aircraft, satellites and marine vehicles.

(U) In the Ship Systems Automation (SSA) area, advanced, highly automated sensor, weapons control, and platform systems (including casualty control) are being developed and demonstrated for submarine and surface ship applications. Through evolving sequential technology demonstrations, efforts in this area will show how an integrated collection of automated systems could achieve an order of magnitude reduction in crew size. Because

RDT&E BUDGET ITEM JUSTIFICATION SHEET (R-2 Exhibit)		DATE February 1997
APPROPRIATION/BUDGET ACTIVITY RDT&E, Defensewide BA 2 Applied Research	R-1 ITEM NOMENCLATURE Tactical Technology, PE 0602702E, Project TT-03	

personnel account for a significant portion of current ships' life cycle costs, such a reduction would lead to immediate and long term cost savings for ship acquisition programs. SSA technology developments include intelligent command-level advanced reasoning components, scalable sensor integration work stations to fuse multi-source data and intelligently display the tactical scene on a situation assessment system, cooperating expert agents conducting mission-context/sensor employment planning, and integrated internal condition sensor and control systems to intelligently display and control ship physical conditions on a ship's internal assessment system.

(U) The Advanced Electric Ship program, planned for FY 1999, will develop and demonstrate critical technologies that are focused toward the affordability of future ships. Candidates to be considered include extensive use of advanced electrical machinery and control systems to take advantage of Commercial-Off-the-Shelf (COTS) equipment, and electric drive for ship's propulsion. Other areas for consideration will include widespread use of composites and development of advanced coating systems for reduced maintenance.

(U) 3-D High-Resolution Digital Terrain Mapping will support the Naval Fire Support (NFS) missions in the littoral environment by development of advanced 3-D radar technologies which will enable the Commander Joint Task Force (CJTF) to obtain precise realtime 3-D maps of littoral environments. These precision 3-D maps provide accurate position information of all objects in the littoral theater and will be required for next generation smart munitions and surveillance systems. All weather interferometric sensors for precision 3-D characterization and surveillance of littoral environment will require the development of broadband planar antenna active arrays, precision attitude measurement systems using inertial navigation systems tightly coupled with space based precision frequency and time sources. This effort will also develop and demonstrate advance radar waveforms and processing algorithms required for precision geolocation by standoff sensors.

(U) In the Command, Control, Communication, and Intelligence/Synthetic Environment (C3I/SE) area, advanced information technologies are being integrated and applied to provide improved battlefield awareness and battlefield dominance to mobile command centers in the field (e.g., Force Commanders, Commander Joint Task Force (CJTF), and deployed Joint Special Operations Task Force (JSOTF) Commanders). The advanced prototype systems developed under this program integrate the latest technologies in high-bandwidth communications, object oriented information system, collaborative planning, intelligent database access, image processing, data exploitation, and high performance computing to address the unique (quick reaction and real-time execution) requirements of forward deployed, mobile commanders. It also develops the Synthetic Test Range (STR), which in conjunction with the Simulation Based Design

(SBD) development, is aimed at improving the acquisition process. The STR concluded in FY 1996 and transitioned to Naval Sea Systems Command. In FY 1996, the program began emphasizing collaborative crisis understanding and mitigation, developing tools and systems necessary to recognize, understand, forecast, and defuse potential crisis situations. Collaborative Crisis Understanding will substantially reduce the time necessary to form teams, analyze crisis data, and develop and brief response options. This effort is focused on the National Command Authority, National Security Council, and the National Military Command Center.

(U) Program Accomplishments and Plans:(U) FY 1996 Accomplishments:

- Conducted Simulation-Based Design (SBD) prototype demonstrations on a complex ship application at distributed design and visualization centers linked via nationwide networks; the first, a joint demonstration in support of the Defense Modeling and Simulation Office High Level Architecture; the second, a virtual prototype of a ship combat system using an electronic smart product model to demonstrate functional requirements. (\$9.5M)
- Initiated expansion of Simulation-Based Design (SBD) through application to development programs for small rapid satellite manufacturing, selected aircraft sub-system manufacturing, land vehicle power train design, and ship manufacturing enterprise. (\$4.9M)
- Conducted high fidelity radar simulation with an operational radar system, transitioned to Navy users. (\$1.8M)
- Initiated collaborative crisis understanding and mitigation effort, developed concept of operations and visualization demonstration emphasizing data mining, modeling and collaboration in response to pre-crisis indicators. (\$1.7M)
- Conducted demonstration and testing of campaign operations planning system applied to joint forces command and control in a deployable package. (\$3.9M)
- Demonstrated advanced Ship Systems Automation (SSA) technologies that enable a few operators to collaborate with advanced reasoning systems to manage the construction of a complex multi-warfare, multi-sensor fusion tactical scene and the effective operation of a combatant ship in that scene. Intelligent System Interface and advanced sensors technologies will continue to be developed and demonstrated. (\$9.8M)
- Continued the most promising ocean sciences efforts at the Center of Excellence for Research in Ocean Sciences (CEROS). Issued a Broad Agency Announcement and selected eleven innovative marine technology projects for initiation. (\$6.9M)

(U) FY 1997 Program:

- Conduct Interim Simulation-Based Design (SBD) prototype engineering demonstration tests, in conjunction with ongoing acquisition programs of the multi-disciplinary engineering analysis capability supported by the advanced computational core architecture. (\$8.4M)
- Initiate SBD prototype engineering tests of the smart product model in support of integrated life cycle requirements and analyses of an evolving maritime application. (\$2.2M)
- Demonstrate automated situation assessment and fusion of a complete multi-warfare tactical scene (air, surface, subsurface), tactical planning, and self-defense capabilities for ship and associated command platforms. Also demonstrate advanced reasoning systems for platform monitoring and control, intelligent construction and presentation of platform status and planning, and automated damage control/recovery reasoning. (\$6.6M)
- Initiate the development of a software system for collaboratively constructing quantifiable crisis and an "intelligent agent" which can browse across dissimilar, existing databases. (\$2.0M)
- The following activities were funded by Congressional additions to the FY 1997 President's Budget:
 - Ship Systems Automation (SSA) - Install, test, and deploy on a Navy submarine the SSA Tactical Scene Operator/Associate (TSO/S), a multi-hypothesis data fusion system which analyzes sensor data and intelligence reports and displays the surface/subsurface tactical scene. (\$2.5M)
 - Simulation-Based Design (SBD) - Make available SBD prototype software to DoD Service's beta sites and acquisition programs for use, evaluation, and feedback. (\$3.0M)
 - Center of Excellence for Research in Ocean Sciences (CEROS) - Continue most promising ocean sciences efforts at the CEROS. (\$7.0M)

(U) FY 1998 Program:

- Continue systems development and initiate development of a tool for rapid, collaborative plan development, evaluation, and briefing; demonstrate and evaluate retrieval agents; demonstrate use of access templates and profiles; evaluate filters. Demonstrate the ability to navigate several of the most important, crisis-related databases for acquiring information on a simulated crisis. (\$3.6M)
- Evaluate ability to quantify centers-of-gravity and pressure points for plan development, and demonstrate modeling capabilities at Joint Task Force ATD/Global Command and Control System Insertions. Demonstrate crisis briefing capability for prioritizing policy and plans at National Security Council/National Military Command Center and supporting intelligence agencies. (\$5.1M)
- Design a system-level brassboard demonstration of a lightweight, very broadband, phased-array-antenna and attitude-measurement system capable of 3-D, high-resolution Digital Terrain Mapping. (\$1.5M)

(U) Change Summary Explanation:

FY 1996 Reflects program repricing and reprogramming of SBIR funds to a separate PE.

FY 1997-98 Decrease reflects phase down of the Simulation Based Design (SBD) and Ship Systems Automation (SSA) Programs that are scheduled to be completed at the end of FY 1997.

FY 1999 Decrease reflects completion of SBD and SSA, offset by initiation (FY 1998) and expansion (FY 1999) of 3D mapping radar efforts and affordable ship initiatives.

Advanced Land Systems Technology TT-04	31,708	21,247	26,000	30,000	33,909	51,686	61,686	69,886	Continuing	Continuing

(U) **Mission Description:** This project is intended to develop technologies for contingency missions and military Operations-Other-Than-War (OOTW) to make U.S. combat forces more deployable, effective, survivable, and affordable. This project supports seven main efforts: Small Low-Cost Interceptor Device (SLID) and SLID Testing; a Foreign Cooperative Demonstration; Day Sight; Advanced Fire Support Systems; Unexploded Ordinance Detection; OOTW; and Small Unit Operations (SUO).

(U) The SLID program is developing and testing a system for providing protection against missiles and projectiles with explosive warheads. This system will detect, track and intercept these threats at a standoff distance sufficient to render them ineffective. Applications for the SLID system include: self-defense of vehicles; high value fixed sites such as command centers, parked aircraft and radars; and may be extended to naval platforms and low-speed aircraft.

(U) The Foreign Cooperative Demonstration program is fabricating and demonstrating a new system for enhancing the survivability of armored vehicles based on technology developed by a foreign source.

(U) The Magic Vision Program will develop and demonstrate an integrated system that will generate obscuring smoke to deny adversary forces the ability to see on the tactical battlefield, while providing our forces with thermal imaging sensors to see through the smoke. The proliferation of short wavelength infrared (SWIR) (less than 1 mm) image intensifier night vision goggles is diminishing US forces' advantage in nighttime tactical operations. Magic Vision will demonstrate the potential to regain this advantage. The program will investigate the integration of man-portable, non-toxic, environmentally friendly smoke generation with head-mounted, uncooled long wavelength infrared (LWIR) (8 - 12 mm) sensors. The smoke to be used will obscure visibility through SWIR in all operations (day/night, tactical, small unit operations, etc.), but will transmit the LWIR. Based on over two decades of DARPA-pioneered research in uncooled LWIR focal plane arrays, the US has a significant technical advantage in this technology. The concept can be exploited further with Combat ID systems which operate in the LWIR. The sensor technical challenges include sufficiently low weight, power, bulk, and cost for realistic man portable applications. The smoke challenges will include man-portability (3 - 5 gallons), rapid dispensing (45 seconds), cloud area (400 square meters), and cloud persistence (20 minutes in absence of wind).

RDT&E BUDGET ITEM JUSTIFICATION SHEET (R-2 Exhibit)		DATE	February 1997
APPROPRIATION/BUDGET ACTIVITY RDT&E, Defensewide BA 2 Applied Research		R-1 ITEM NOMENCLATURE Tactical Technology, PE 0602702E, Project TT-04	
<p>(U) The Advanced Fire Support Systems program will develop and test systems to provide the rapid response and lethality associated with gun and missile artillery in packages which require significantly fewer personnel, require decreased logistical support, and have increased survivability compared to current systems. The program will develop and demonstrate a highly flexible system including a guided projectile/munition, a remotely commanded self positioning launcher, and a command and control system compatible with military doctrine.</p> <p>(U) The Unexploded Ordnance (UXO) Detection program will develop sensors for the chemically specific detection of explosives or other chemicals characteristic of land mines and/or shallowly buried UXOs. The sensors developed under this program will provide soldiers with the effectiveness of canine olfaction detection without the logistics and other constraints imposed by the use of live animals. These chemically specific sensors will work either singly or in conjunction with other technologies (such as the hyperspectral mine detector, developed under the Small Unit Operations (SUO) program) that exploit different physical features.</p> <p>(U) OOTW encompassed a wide range of activities where military power is used for purposes other than large scale combat. The purpose of the DARPA OOTW research and development program was to develop and demonstrate technologies that increase operational effectiveness in the multi-national, multi-lingual OOTW environment. Funding for this program was completed in FY 1996.</p> <p>(U) The SUO program is developing the key technologies to enable more capable, dispersed military units to effectively perform warfighting operations traditionally accomplished with massed forces. The SUO program focuses on enabling comprehensive awareness at the tactical level in restrictive environments. Sniper/mortar detection and hyperspectral infrared mine detection work initiated under the OOTW program will be continued with an emphasis on small unit operations. In FY 1997, these SUO efforts were realigned into Project LNW-02.</p> <p>(U) <u>Program Accomplishments and Plans:</u></p> <p>(U) <u>FY 1996 Accomplishments:</u></p> <ul style="list-style-type: none"> • Operations-Other-Than-War (OOTW) and Unexploded Ordnance (UXO). (\$7.7M) <ul style="list-style-type: none"> - Completed the Soldier 911 demonstrations in Korea and Macedonia, and the Korean/English text translator. - Completed modular tag concept definition phase. - Continued mine/unexploded ordnance detection technology development, including chemically-specific detection techniques such as nuclear quadrupole resonance.

R-1 ITEM NOMENCLATURE

Tactical Technology,
PE 0602702E, Project TT-04

- Completed background/clutter data collection at four sites using traditional sensors as well as preliminary tests to determine the chemical signature in and around buried mines.
- Demonstrated the Korean/English speech translator, the concealed weapons system, extremity armor, and limited effects technology.
- Demonstrated a vehicular mounted surveillance and dazzler system, improved (less lethal) pyrotechnic devices, and a wireless stun projectile.
- Continued development of sniper, mortar, hyperspectral infrared mine, and thru-wall detection technologies with emphasis on small unit operations. (\$10.8M)
- Initiated Small Low-Cost Interceptor Device (SLID) phase II fabrication and testing effort with remaining contractors. Performed sub-system tests leading to static system tests. (\$11.2M)
- Initiated development of the system for the Foreign Cooperative Demonstration. (\$2.0M)

(U) FY 1997 Program:

- Continue SLID phase II effort. Conduct full system static tests and tests against slowly moving targets. Prepare for live-on-live tests. (\$12.5M)
- Complete the Foreign Cooperative Demonstration testing and transition program to the Army. (\$1.9M)
- Continue chemically-specific unexploded ordnance/mine detection technology development. Characterize explosive and other related chemical contamination at minefield. Evaluate advanced algorithms and sensor fusion capabilities for multiple-sensor detection. (\$6.8M)

(U) FY 1998 Program:

- Complete live-on-live Small Low-Cost Interceptor Device (SLID) testing. (\$7.0M)
- Field demonstration of laboratory scale system for chemically specific detection of land mines. (\$12.0M)
- Initiate the Advanced Fire Support System development including concept and requirements analysis of loitering platforms and unmanned missile artillery packages, Phase I system designs, and hardware risk mitigation experiments. (\$4.0M)
- Assess current state of relevant smoke and LWIR sensor technologies; determine needed modifications or improvements; select a single application (such as Small Unit Operations or Military Operations in Urban Terrain) for demonstration; and design and execute demonstration. (\$3.0M)

(U) FY 1999 Program:

- Extend SLID protection range, demonstrate application to high value fixed sites, and transition to the U.S. Army. (\$7.0M)

(U) **Mission Description:** This project focuses on eight broad technology areas: (a) compact, efficient, frequency-agile, diode-pumped, solid-state lasers for infrared countermeasures, laser radar and sensors; (b) compact high density holographic data storage for high bandwidth image processing and access to large data bases; (c) high performance computational algorithms for signal processing, target recognition and tracking, electromagnetic propagation, and processing of advanced materials and microelectronics; (d) precision optics components for critical DoD applications; (e) passive infrared signature suppression to counter air-to-air missile threats; (f) tactical landing systems; (g) miniature air-launched decoy systems; and (h) an affordable rapid response missile demonstration.

(U) **Program Accomplishments and Plans:**(U) **FY 1996 Accomplishments:**

- Compact Lasers. (\$7.3M)
 - Demonstrated compact lasers at mid-infrared wavelengths for infrared (IR) countermeasures.
 - Demonstrated mid-infrared lasers with 2 watts output power and a modulated pulse repetition frequency of 10 kilohertz, packaged in a compact configuration for field testing.
 - Demonstrated pulsed operation of quantum cascade diode lasers operating at mid-infrared wavelengths.
 - Demonstrated frequency conversion into mid-infrared wavelengths using periodically poled lithium niobate crystals.
- Holographic Data Storage. (\$5.9M)
 - Performed technology demonstration to establish system trade-offs of various candidate materials for holographic data storage.
 - Demonstrated proof-of-principle digital holographic data storage devices to establish the capability of various multiplexing methods and error detection and correction schemes.
- Fast Computational Algorithms. (\$13.2M)
 - Demonstrated wavelet-based methods for automatic target detection and recognition.
 - Demonstrated multiresolution methods and adaptive waveforms for image formation and processing.
 - Developed hybrid automatic target recognition strategy for synthetic aperture radar exploiting most advantageous features of both wavelets and nonlinear partial differential equation-based methods.

Tactical Technology,
PE 0602702E, Project TT-06

- Developed 3D implementation of fast multipole method for radar cross section calculations.
- Identified approaches to reducing high-order nonlinear descriptions of thin film processes to real-time sensing and control models.
- Precision Optics Technology. (\$2.7M)
 - Developed requirements and performed initial calculations for conformal and off-axis optical components for next generation tactical systems.
- Advanced Infrared Signature Suppression. (\$.9M)
 - Integrated and demonstrated (flight test) a long-wave infrared (LWIR) suppression system.
- Tactical Landing System (TLS). (\$6.3M)
 - Fabricated and demonstrated a transportable TLS designed for minimal installation/calibration times; accuracy improved through the addition of phase measurement capability; integrity monitoring feature added to permit autonomous operation.
- Miniature Air-Launched Decoy. (\$.7M)
 - Conducted engine independent validation and established system design.

(U) FY 1997 Program:

- Compact Lasers. (\$5.9M)
 - Demonstrate breadboard systems of compact high power tunable mid-infrared lasers, and laser diodes operating at mid-infrared wavelengths.
- Demonstrate breadboard tunable mid-infrared lasers with 20 watt output power at 20 kilohertz (kHz) pulse repetition rate for ship defense.
- Demonstrate room temperature operation of continuous wave mid-infrared laser diodes.
- Demonstrate active tracking system at mid-infrared wavelengths.
- Holographic Data Storage. (\$5.1M)
 - Technology demonstration to establish functional limits of holographic data storage.
 - Demonstrate 1 terabit storage capacity for functional evaluation of write once and read many type storage systems.
- High Performance Algorithm Development. (\$10.6M)
 - Demonstrate classification performance improvement for Longbow fire control radar achieved using a wavelet classifier.
 - Apply adaptive waveform designs to radar and communication.
 - Apply multiresolution methods to image processing and formation.
 - Select applications for development of wavelet-based detection, discrimination, and classification strategies.

- Develop new strategies for data, sensor, and algorithm fusion for signal and image processing applications that exploit the feature extraction capability of wavelets.
- Demonstrate orders-of-magnitude processing reductions provided by parallel implementation of fast multipole techniques to radar cross section calculations.
- Develop methods for calculating electromagnetic scattering from objects in ground clutter.
- Advanced Mathematics for Microstructural Process Control. (\$4.4M)
 - Enhancement of strategies for physicochemical modeling of thin film vapor deposition processes that integrate process, sensing, and control considerations and provide understanding of critical microstructure issues needed to design high-quality and high yield manufacturing processes.
 - Develop fast algorithms for modeling and design of large-scale, high-performance circuits.
- Precision Optics Technology. (\$6.3M)
 - Continue development of conformal and off-axis optical components for tactical systems.
 - Develop magneto-rheological finishing for aspheres, toroids and cylinders.
 - Demonstrate design tools for conformal and off-axis optical systems.
- Miniature Air-Launched Decoy (MALD). (\$3.0M)
 - Establish MALD critical design and final design specifications. Conduct flight testing with proof-of-concept vehicle and risk reduction testing on engine. Begin flight system fabrication, integration, assembly and qualification testing of subsystems. Initiate Seek Eagle Process. Begin refinement of operational concept for MALD.

(U) FY 1998 Program:

- Compact Lasers. (\$5.5M)
 - Demonstrate compact high power tunable lasers and laser diodes at mid-infrared wavelengths.
 - Develop breadboard tunable mid-infrared lasers for airborne infrared countermeasures.
 - Demonstrate room temperature long wavelength laser diodes in the 7-to-9 micrometer wavelength range.
- Holographic Data Storage. (\$4.1M)
 - Demonstrate 1 terabit storage capacity for functional evaluation of read/erase type storage systems.
- High Performance Algorithm Development. (\$13.9M)
 - Implement a hybrid automatic target recognition strategy for synthetic aperture radar exploiting most advantageous features of wavelets and nonlinear partial differential equation-based methods.
 - Develop application-specific wavelet-based automatic target recognition algorithms.
 - Continue development of most promising strategies for data, sensor, and algorithm fusion that exploit the feature extraction capability of wavelets and apply to signal and image processing.
 - Develop prototype electromagnetic scattering models for objects in ground clutter.

(U) **Mission Description:** Aeronautics Technology efforts will address high payoff opportunities to dramatically reduce costs associated with advanced aeronautical systems or provide revolutionary new system capabilities for satisfying current and projected military mission requirements.

(U) A new family of Micro-Air Vehicles (MAVs) which are at least an order of magnitude smaller than current flying systems (less than 15 cm in any dimension) will be developed and demonstrated. The capability to accomplish unique military missions as diverse as covert imaging in constrained areas, biological-chemical agent detection and characterization, remote precision mines, and urban battlefield communications enhancement, will be stressed through an examination of a variety of vehicle concepts. The resulting capability should be especially beneficial in the emerging urban warfighting environment, characterized by its complex topologies, confined spaces and areas (often internal to buildings), and high civilian concentrations. The MAV program will focus on the technologies and components required to enable flight at these small scales, including flight control, propulsion and lightweight power, navigation and communications, building upon and exploiting numerous DARPA technology development efforts, including advanced communications and information systems, high performance computer technology, Microelectromechanical Systems (MEMS), advanced sensors, lightweight, efficient high density power sources, and advanced electronic packaging technologies.

(U) The feasibility of developing and demonstrating a family of Unmanned Tactical Aircraft (UTAs) will be investigated and an Advanced Technology Demonstration of one member of this family of UTAs will be conducted. This UTA will be called the Urban Combat Vehicle (UCV). It will be a small, inexpensive aircraft, capable of operating from austere land bases and air capable ships. The UCV will be able, with the assistance of a ground-based controller, to proceed to the target area, identify a potential target or targets, and release a loitering weapon or weapons. Either autonomously through target recognition, or through the assistance of a ground controller, the loitering weapon will precisely locate and destroy its target.

(U) **Program Accomplishments and Plans:**(U) **FY 1996 Accomplishments:**

- Initiated assessments of operational scenarios, candidate MAV configurations, and critical component technologies including four SBIR tasks. (\$1.0M)
- Conducted Unmanned Tactical Aircraft (UTA) feasibility analyses and design trade studies. (\$1.1M)

* Additional funding for this program was in PE 0602301E, Project ST-11 (\$4.1M).

(U) **Mission Description:** The Advanced Logistics Program will investigate and demonstrate technologies that will make a fundamental difference in transportation and logistics. The program will define, develop, and demonstrate fundamental enabling technologies that will permit forces and sustainment materiel to be deployed, tracked, refurbished, sustained, and redeployed more effectively and efficiently than ever before. Currently, this is accomplished using isolated, independent, and sometimes incompatible systems, processes and data. Therefore, the very rapid replanning and redirection necessary to support missions involving simultaneous local and major regional conflicts cannot be accomplished today. The Advanced Logistics Program will address these shortcomings and enable this significant capability to be developed. In addition, the project has enormous potential for cost savings through greatly improved management of transportation and logistics assets.

(U) Additionally, this program will develop automated, multi-echelon, collaborative logistical/transportation technologies that will provide warfighters with an unprecedented capability to monitor, rapidly replan and re-execute logistical support, even while assets are enroute to the theater. The Advanced Logistics Program will focus on three areas: 1) Development of a computer network infrastructure that allows distributed real-time visualization and interaction with all phases, elements and components of the military and commercial transportation infrastructure; 2) Development of applications providing a technology environment that allows warfighters to rapidly understand and assess the logistics and transportation implications of a crisis situation, to generate effective plans and courses of action, to monitor a plan's execution, and to use that information to re-plan; and 3) Automated systems that will enable significant efficiency improvements in transportation and logistics, such as monitoring the condition of assets and the infrastructure, the creation of "plan sentinels" to serve as an early warning system for plan deviations, and improved theater distribution. The capabilities from these three areas will be integrated to demonstrate an end-to-end system solution.

(U) The Advanced Logistics Program supports joint initiatives with the Defense Logistics Agency and is coordinated with other related logistics efforts within the DoD. As these technologies mature, they will immediately transition to other joint initiatives which include: the Defense Logistics Agency Logistics Research and Development (PE 0603712S), the Joint Logistics Advanced Concept Technology Demonstration (TT-11), and eventually to the Global Command and Control System (GCCS) and the Global Combat Support System (GCSS).

Tactical Technology,

PE 0602702E, Project TT-10

(U) Program Accomplishments and Plans:(U) FY 1996 Accomplishments:

- Initiated development of a distributed logistics and transportation network including development of information manipulation and planning technologies to support planning, execution, monitoring and focused replanning throughout the logistics pipeline. (\$2.3M)
- Initiated definition of technology requirements for data gathering and measurement of the logistics execution environment including data gathering technologies for semi-autonomous capture, search and retrieval of data in disparate defense and commercial logistics sources and advanced tagging/locating/measurement sampling systems and software. (\$2.0M)

(U) FY 1997 Program:

- Continue architecture development and demonstrate a distributed logistics planning, execution, and monitoring system concept to support inland military logistics planning/replanning from origin to port. (\$6.0M)
- Conduct a feasibility demonstration of advanced technologies for logistics support planning, measurement sampling, and software systems. (\$3.0M)
- Initiate proof of principle for advanced software data collection techniques (also referred to as knowledge rovers or intelligent software agents) that search the Global Information Infrastructure for relevant logistics information and data and return it to the user. Initiate development of multi-echelon collaborative logistical support technology that integrate planning, execution, monitoring and decision support systems for testing and fielding. Conduct concept formulation and initial utility demonstration of "plan sentinels" to detect plan deviations within a rapid replanning environment. Develop an integrated software framework that is reusable and reconfigurable. (\$9.3M)

(U) FY 1998 Program:

- Demonstrate an integrated computer environment to support automated planning, execution and monitoring of a major force deployment from fort to port to ship load, including optimized scheduling and routing with minimal staging throughout the move. (\$8.0M)
- Initiate development of plan deviation detection sentinels and predictive analysis to assist in identification of replanning opportunities. (\$8.0M)
- Continue development of advanced software data collection techniques. Initiate development of a Dynamic Critical Items List for sustainment planning and execution. Continue development of multi-echelon collaborative logistical support technologies. Develop and demonstrate initial automated coarse-grained course of action evaluation that is linked to the war plan. (\$9.7M)

(U) FY 1999 Program:

- Demonstrate an integrated environment to support the planning, execution and monitoring of a major force deployment from point of debarkation through in-theater distribution, including automated infrastructure assessment and monitoring. (\$10.0M)
- Develop and demonstrate the ability to negotiate the exchange of information between suppliers and buyers, including rapid, flexible item and item relationship catalogs. (\$7.0M)
- Extend "plan sentinels" for automated deviation detection and triggering of the replanning processes. Continue development of a Dynamic Critical Items List for sustainment planning and execution. Develop and demonstrate automated medium grained course of action evaluation that is linked to the war plan. (\$10.7M)

* The FY 1997 Joint Logistics ACTD effort was funded by the Army in PE 0603734A. The DARPA funding under this project continues the effort and expands the tools into a joint common operating environment.

(U) **Mission Description:** The Joint Logistics Advanced Concepts Technology Demonstration (JL ACTD) is a multi-phase program which will provide an experimental environment where logisticians can evaluate maturing tools and technologies for increased operational capability. Initial efforts will integrate existing tools that exploit near real-time logistics data sources operating within the Global Combat Support System (GCSS). Key data sources include Joint Total Asset Visibility (JTAV), Joint Personnel Asset Visibility (JPAV), and Global Transportation Network (GTN). This program will also provide a migration path for evaluating advanced technologies that are being developed by other programs such as the DARPA Advanced Logistics Technology Program (TT-10), the Battlefield Awareness and Data Dissemination ACTD, the Joint Force Air Component Commander (JFACC) Program, and the Advanced Joint Planning ACTD. The ACTD will provide logisticians the opportunity to assess the operational impact of emerging tools and technologies. Focus areas include maintaining asset visibility and control, monitoring real time execution of plans, and re-planning logistics operations to rapidly re-prioritize and redirect combat support. The ACTD will support CINC/JTF and Service/Agency logisticians across the entire operational spectrum -- mobilization, deployment, employment, sustainment and redeployment.

(U) Program Accomplishments and Plan:(U) FY 1996 Accomplishments: N/A(U) FY 1997 Program: N/A(U) FY 1998 Program:

- Define operational architecture and network requirements for employment of joint decision support tools for CINC's, Components, and Services that operate within the GCSS environment and exploit near real-time data feeds (JTAV, JPAV, GTN, etc.). (\$3.3M)
- Integrate initial joint logistics tool sets and field at selected demonstration sites. (\$6.5M)
- Demonstrate access within GCSS environment in a joint warfighting exercise. (\$1.5M)

(U) **Mission Description:** This program element is budgeted in the Applied Research Budget Activity because it develops the technology and manufacturing capability for high definition displays and is important for virtually all DoD applications that involve visual and graphic information. Major components of this program include: projection, head mounted and direct view displays based on multiple technologies; development of equipment and components required to manufacture advanced display technologies, and prototype display systems for system evaluation. These efforts will establish a domestic technical capability and demonstrate the manufacturing capability of components necessary for military systems that capture, process, store, distribute and display high resolution images.

(U) **Program Accomplishments and Plans:**(U) **FY 1996 Accomplishments:**

- Continued development of flat panel and projection displays for mobile displays, and shipboard and landbased command and control centers. (\$19.3M)
- Continued development of equipment and components to meet display cost and performance goals. This included efforts in patterning, film deposition and annealing, and field emission display materials and assembly tools, as well as reflective liquid crystal materials and phosphor technology development. (\$17.1M)
- Developed system prototypes which leveraged earlier developed display technologies and incorporated integrated systems and intelligent interfaces. (\$8.0M)

(U) **FY 1997 Program:**

- Continue development of next generation reflective and emissive mobile display technologies and laser based projection systems for command and control applications. (\$17.5M)
- Continue development of equipment and components to meet display cost and performance goals. This will include efforts in field emission display materials, organic light emitting materials, reflective liquid crystal materials, phosphor technology development, and support for domestic display manufacturing infrastructure. (\$29.1M)
- Continue development of system prototypes which leverage earlier developed display technologies and incorporate integrated systems and intelligent interfaces. (\$13.1M)

(U) **Mission Description:** This program element is budgeted in the Applied Research Budget Activity because its objective is to develop technology related to those materials, electronics, and medical devices that make possible a wide range of new military capabilities.

(U) The Materials Processing Technology project (MPT-01) concentrates on the development of novel materials, materials processing techniques, and mathematical models and fabrication strategies for advanced structural and functional materials and components which will lower the cost, increase the performance, and enable new missions for military platforms and systems. Areas of concentration include exploitation of emerging processing approaches to tailor the properties and performance of structural materials and devices. This emphasis includes lightweight personnel protection, mesoscale machines for miniature devices, and ultra lightweight materials. The project also focuses on smart materials, sensors and actuators, functional materials and devices, and advanced magnetic materials for non-volatile, radiation hardened magnetic memories. Other areas of concentration include new materials concepts for portable power, protective coating materials to eliminate environmental hazards, infrared artificial dielectrics, development of bio-interface materials and methods, energy harvesting concepts, and frequency agile materials based on ferrite and ferroelectric oxides.

(U) The Microelectronics Device Technologies project (MPT-02) develops advanced electronic and optoelectronic devices, semiconductor process tools and methodologies, materials for optoelectronics and infrared devices. Areas of emphasis include high-performance analog-to-digital converters, military optical processors, novel optoelectronic

devices and components, high temperature electronic devices, and high power electronics. This project includes a significant effort to develop advanced materials and device technology beyond the classical scaling limits of silicon device technology.

(U) In the Cryogenic Electronics project (MPT-06), thin film electromagnetic materials have reached a stage of development where specific applications can be identified in electronic devices and circuitry for military applications. Thin-film high temperature superconducting components packaged with cryogenic devices are being applied to radars, electronic warfare suites, and communications systems to enhance performance while reducing size and power requirements. Highly dependable and inexpensive cryocoolers (including thermoelectric coolers) are being developed for these applications, and expanded efforts will explore techniques to improve the performance of all solid state thermoelectric coolers as well as the overall cryogenic performance in applications ranging from communications to computing.

(U) Military Medical/Trauma Care Technology project (MPT-07) is an initiative to significantly improve far-forward battlefield trauma care. The project focuses on the human factors of advanced technology concepts in a front-line battlefield environment through development of body-worn monitors, field-portable digital imaging equipment, battlefield surgical simulation and high-fidelity imaging for ultrasound.

RDT&E BUDGET ITEM JUSTIFICATION SHEET (R-2 Exhibit)										DATE	February 1997
APPROPRIATION/BUDGET ACTIVITY		R-1 ITEM NOMENCLATURE									
RDT&E, Defensewide BA 2 Applied Research		Materials and Electronics Technology, PE 0602712E									
COST (In Thousands)	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	Cost to Complete	Total Cost	
Materials Processing Technology MPT-01	119,071	117,527	103,822	123,181	124,350	127,927	161,127	174,327	Continuing	Continuing	

(U) **Mission Description:** The major goals of this project are to develop novel materials, materials processing techniques, mathematical models and fabrication strategies for advanced structural and functional materials and components which will lower the cost, increase the performance and/or enable new missions for military platforms and systems.

(U) One important area of concentration is the exploitation of emerging processing approaches to tailor the properties and performance of structural materials and devices. Thrusts in this area include new concepts for lightweight personnel protection, mesoscale machines for miniature devices, and ultra lightweight materials for lowering the weight and increasing the performance of aircraft and spacecraft structures. Smart materials, sensors and actuators for the control of the aerodynamic and hydrodynamic behavior of military systems are being developed and demonstrated to increase performance and lower detectability of aircraft, helicopters and submarines.

(U) A second major thrust is the development of functional materials and devices. This includes advanced magnetic materials for high sensitivity, magnetic field sensors and non-volatile, radiation hardened magnetic memories with very high density, short access time, infinite cycle ability and low power. Frequency-agile materials based on ferrite and ferroelectric oxides will be developed for tuned filters, oscillators and antennas. New materials and concepts for increasing the availability of portable power to the soldier are also being investigated as are substitute protective coating materials which eliminate environmental hazards. Infrared Artificial Dielectrics (IRADS) are a new class of infrared materials having an emissivity that can be fully engineered for different spectral bands. For example, it may be possible for IRADS to camouflage hot objects from passive infrared sensors operating in the common 8-to-12 micron band.

(U) The unique characteristics of biologically derived devices will be exploited through the understanding and control of the structure and chemistry of the interface between man-made and biotic materials. For example, we will develop bio-interface materials and methods for preventing pathogens (biological warfare agents) from entering a warfighter's body and, once in the body, prevent them from causing disease. Approaches include advanced biomaterial barriers and elimination techniques to prevent pathogen entry and augment the warfighter's immune response to pathogens.

(U) Program Accomplishments and Plans:(U) FY 1996 Accomplishments:

- Structural Materials and Devices. (\$32.3M)
 - Demonstrated full-scale rapid densification of carbon-carbon composite components.
 - Demonstrated a five-fold improvement in the life of the roll reaction control (RRC) valve bearings on the AV-8B Harrier aircraft due to the upgrade of the metal bearings with ceramic hybrid bearings.
 - Validated the Resonant Ultrasonic Inspection technique for ceramic rolling elements through beta site testing at a commercial ball bearing finisher.
 - Demonstrated production of voided and foamed aluminum and titanium core materials for ultra lightweight panels.
 - Demonstrated low cost aluminum-beryllium aerospace structure fabrication processes.
 - Demonstrated reduced mean-time-between-failure (MTBF) associated with the upgrade of glass optical domes to spinel domes used in the Angle Rate Bombing Set (ARBS) of the AV-8B Harrier aircraft.
 - Demonstrated the use of X-ray tomography and developed software to generate computer aided design (CAD) files from solid objects compatible with the requirements of solid freeform fabrication.
 - Developed the machine capability to produce silicon nitride components using the fused deposition method with silicon nitride powder loaded wax filaments.
 - Demonstrated the capability to fabricate molds for slip casting structural ceramics and for producing low cost resin transfer molding tooling using 3-D printing technology.
 - Designed an advanced polarization preserving fiber optic connector.
 - Developed a chemical vapor deposition (CVD) process for the fabrication of particulate and chopped fiber reinforced composites with a 10X increase in composite growth rate over normal CVD processing; demonstrated the utility of the fabricated composites for the die casting of copper alloys.
 - Developed feedback control methods for plasma sprayed metal matrix composites.
 - Developed new casting practices which will reduce the emissions of foundries with focus on characterization of emissions in current casting processes, core and mold making technology, metal melting treatments and handling, sand reclamation, and emissions control.
- Smart Materials and Actuators. (\$20.8M)
 - Demonstrated the application of smart materials to reconfigurable machines and tooling hardware.
 - Analyzed smart material applications for submarines.
 - Demonstrated material sensor and activator components manufacturability utilizing piezoelectric ceramics and electrostrictors.

R-1 ITEM NOMENCLATURE

Materials and Electronics Technology,
PE 0602712E, Project MPT-01

- Completed wind tunnel testing of first iteration shape adaptive F-18 wing model.
- Functional Materials and Devices. (\$40.3M)
 - Demonstrated prototype multichip modules (MCM) with laminate technology roll-to-roll processing.
 - Demonstrated a prototype MCM for a missile guidance section using a bare die on a laminate substrate and electronically validated its performance.
 - Developed simulation codes for the physics of vapor deposition and validated on industrial processes.
 - Demonstrated a process to produce elastomeric electrorheological materials for acoustic wave filtering applications.
 - Demonstrated large area, high deposition rate chemical vapor deposition (CVD) of diamond substrates.
 - Identified processing approaches for manufacturing high thermal conductivity (>10W/K-cm), low-cost (<\$1/carat) diamond for thermal management of defense electronics.
 - Initiated the demonstration of thermal management diamond in specific defense applications (e.g., high power transmit-receive modules, electronic warfare (EW) systems).
 - Developed stable contacts for high temperature, high power semiconductors.
 - Demonstrated high yield, large area processing of thin film, high temperature superconducting devices.
 - Developed giant magneto-resistive (GMR) films with enhanced electrical characteristics and enhanced magneto-resistance ratio for higher sensitivity magnetic devices.
 - A model magnetic memory cell design was completed.
- Energy and Environmental Sciences. (\$17.7M)
 - Designed and initiated construction of a hydrothermal oxidation system for shipboard excess hazardous material disposal.
 - Demonstrated more environmentally sound production processes for printed wiring boards.
 - Designed sensors and control models for the intelligent processing of materials to improve the reliability of thermal barrier coatings for turbine engine airfoils and demonstrated these on a production scale reactor.
 - Initiated studies of advanced erosion/corrosion resistant thin film coatings.
 - Established and demonstrated process parameters for the manufacture of copper-indium diselenide (CIS) photovoltaic solar cells in production scale efficiencies of over 8% (photons in to electrons out).
 - Bio Detection & Identification; BW Information Technologies; BW Immediate Response. (\$8.0M)
 - Developed integration technology to insert up-converting phosphors into existing biological warfare agent sensors.
 - Demonstrated feasibility of an aflatoxin biosensor.
 - Initiated design phase of microfabricated polymer bilayer air-fluid sampling inlet.

- Initiated research to identify, purify, and crystallize target enzymes for inhibition of spore germination.
- Developed reference architecture for smart messages system.

(U) FY 1997 Program:

- Structural Materials and Devices. (\$32.7M)
 - Demonstrate a 2X increase in mean-time-between-failures (MTBF) associated with the replacement of carbon engine starter oil face seals on aircraft with ceramic face seals.
 - Demonstrate novel, low cost processing approaches for ceramic composites for use in gas turbine engines.
 - Demonstrate production of titanium components using laser sintering techniques.
 - Demonstrate production of cast aluminum-beryllium components.
 - Demonstrate secondary processing and joining of structurally porous ultra lightweight panels.
 - Demonstrate the capability to produce ceramic components with complex geometry and dimensional tolerances and mechanical properties comparable to mass manufactured advanced ceramics using Jet Printer technology (3-D printing).
 - Develop a new solid freeform build method for ceramic components based on layer-by-layer photolithography utilizing either large area liquid crystal display or a light emitting diode display technology for electronically programmable photomasks.
 - Determine the feasibility of using new processing approaches (e.g., solid freeform fabrication) for controlling the dimensional tolerances, microstructural and mechanical properties, and affordability required for components and mesoscale machines.
 - Test reconfigurable machines and tools in shop floor beta test sites.
 - Determine the performance characteristics of low cost, damage tolerant fibrous monolith components in engine environments.
 - Demonstrate control of physical vapor deposition metal-matrix processing and extend process control models to physical vapor deposition of metal coated fibers in 60 filament bundles.
 - Demonstrate the fabrication of nanostructured, hard carbon coatings with high adhesion, low friction, high hardness and high wear resistance.
 - Determine the economic viability of Templated Grain Growth (TGG), a process by which solid phase epitaxy of crystallographically oriented seeds on near net shaped polycrystalline components is used for growth of single crystal-like oxides.
- Smart Materials and Devices. (\$22.3M)
 - Demonstrate a fabrication process for microintegrated smart materials.

- Demonstrate vibration reduction by a factor of ten in machine tools via specially designed sensor/actuator elements to enhance machining tolerances.
- Construct fully integrated hydro-acoustic noise suppression tile.
- Conduct wind tunnel test of second generation shape adaptive F-18 wing model.
- Demonstrate vibration suppression in subscale helicopter blades in hover stand and wind tunnel tests.
- Functional Materials and Devices. (\$43.7M)
 - Complete development of a plasma/ion etch numerical simulation.
 - Demonstrate predictive capability of high-pressure, low-order, chemical vapor deposition models and demonstrate feedback control to a desired wafer state.
 - Demonstrate intelligent processing of large area chemical vapor deposition (CVD) of diamond with production costs of \$1/carat.
 - Demonstrate the advantages of thermal management diamond in the performance of defense electronic systems or subsystems.
 - Grow single crystal boules for two inch diameter silicon carbide semiconductor wafers by scaling up the reactor and developing larger seed crystals.
 - Demonstrate high temperature superconducting technology with greater than fifteen square inch format and greater than eighty percent yield.
 - Demonstrate large area deposition of giant magneto-resistive (GMR) materials.
 - Demonstrate prototype GMR magnetic memory cell and spin transistor memory cell using magnetic multilayers.
 - Begin development of candidate polymers using advanced lithography techniques for infrared artificial dielectrics (IRADs).
 - Initiate effort on nanophase magnetic materials.
 - Energy and Environmental Sciences. (\$18.8M)
 - Demonstrate a hydrothermal oxidation pilot plant for the destruction of shipboard excess hazardous materials.
 - Demonstrate novel recycling/reclamation techniques for disposal of scrap polymer matrix composites.
 - Demonstrate intelligent processing of thermal barrier coatings yielding reliable coatings which increase turbine engine inlet temperatures by up to 200 degrees F, with a commensurate increase of 10-15% in thrust.
 - Develop advanced erosion/corrosion resistant thin film coatings for military applications.
 - Demonstrate high yield, pilot scale production (1.5 megawatt/year) of high efficiency (10%) copper-indium diselenide (CIS) solar cells on flexible substrates; test in a military environment.

(U) FY 1998 Program:

- Structural Materials and Devices. (\$27.9M)
 - Demonstrate low cost titanium and superalloy component fabrication processes.
 - Demonstrate uniformly bonded face sheet attachment on ultra lightweight foamed metal structures.
 - Demonstrate a 5x reduction in prototyping time (print-to-part) for ceramic and metal gas turbine engine components utilizing solid freeform manufacturing.
 - Demonstrate laser workcell at a beta test site.
 - Establish approaches for breakthrough gains in personnel protection performance (e.g., >100% from current capabilities for 7.62 mm armor piercing (AP) round) through the application of innovative materials, materials processing and phenomenological modeling of multicomponent materials systems.
 - Build a high precision silicon nitride roll gimbal and pitch shaft for an infrared (IR) seeker utilizing Shaped Deposition Manufacturing (SDM), which combines additive and subtractive processing.
 - Select and begin a specific mesoscale machine demonstration of interest to DoD (e.g., miniature air sampler, catalytic air purifier, etc.).
 - Evaluate Al-Be F-15 rudder spar.
 - Evaluate structurally porous ultra light weight aircraft panels.
- Smart Materials and Actuators. (\$20.7M)
 - Demonstrate full size smart material active helicopter blade structures and acoustic noise suppression structure on a rotor test stand.
 - Evaluate actuation potential of magnetoelastic and magneto-shape memory transducer materials.
 - Evaluate high performance electroceramic actuator fabrication processes.
 - Demonstrate applicability of a smart shape adaptive wing to vortex destabilization concept in hydro applications.
 - Design, build, test and evaluate high power laminated actuator stacks for smart defense structures utilizing Computer Aided Manufacturing-Laminated Engineering Materials (CAM-LEM) solid freeform fabrication (SFF) capability.
- Functional Materials and Devices. (\$37.5M)
 - Demonstrate a prototype giant magneto-resistive (GMR) magnetic memory array and spin transistor memory cell array using magnetic multilayers.
 - Design and build a very high sensitivity magnetometer.
 - Continue polymer development using advanced lithography techniques for infrared artificial dielectrics (IRADS).

Materials and Electronics Technology,
PE 0602712E, Project MPT-01

- Initiate effort to reduce loss tangent in ferrites and ferroelectric oxides for frequency agile rf components.
- Demonstrate a switched circulator and phase shifter using thick film ferrites.
- Select model systems for establishing the structure and chemistry of biotic/abiotic interfaces providing the capability to design biological devices of interest to DoD (e.g., sensors, smart membranes, actuators, etc.).
- Demonstrate proof of concept for templated vapor phase single crystal growth on projected x-ray interference patterns of atomic dimensions.
- Energy and Environmental Sciences. (\$17.7M)
 - Demonstrate the utility of advanced erosion/corrosion resistant thin film coatings at a military site.
 - Extend concepts of intelligent processing of thermal barrier coatings to complex multilayer systems capable of an additional 200 degrees F in turbine inlet temperature (10-15% additional thrust) without sacrificing reliability.
 - Develop balance-of-plant and packaging for a direct oxidation fuel cell replacement for military standard batteries.
 - Demonstrate that full scale, intelligent processing of copper-indium diselenide (CIS) solar cells yields both performance and cost (<\$1/watt) suitable for use of flexible photovoltaics in military operations.
 - Develop energy harvesting and storage concepts for unattended devices.

(U) FY 1999 Program:

- Structural Materials and Devices. (\$34.4M)
 - Fabricate and test materials and materials systems concepts designed to significantly improve personnel protection performance (e.g., >100% from current capabilities for 7.62 mm armor piercing (AP) round), dramatically increasing protection for the individual soldier.
 - Demonstrate solid freeform fabrication of titanium forging blanks.
 - Demonstrate spray forming of superalloy forging billets.
 - Demonstrate the use of Solid Freeform Fabrication to upgrade distressed turbine vanes in man-rated gas turbine engines with ceramic composite components of high reliability.
 - Demonstrate the construction and performance of a prototype mesoscale machine.
- Smart Materials and Actuators. (\$22.6M)
 - Demonstrate vortex wake reduction for submarines using smart materials.
 - Demonstrate submarine acoustic noise reduction using smart material tiles.
 - Demonstrate a shape adaptive fighter inlet.

(U) **Mission Description:** This project develops advanced electronic and optoelectronic devices, semiconductor process tools and methodologies, materials for optoelectronics, and infrared devices. Areas of emphasis include high performance analog-to-digital converters (ADCs), military optical processors, novel optoelectronic devices and components, high temperature electronic devices and high power electronics. This microelectronics development project develops and demonstrates advanced microelectronics technology for DoD critical needs. Technologies developed in this project are performance driven and exceed commercial capabilities. This project includes a significant effort to develop advanced material and device technology beyond the classical scaling limits of silicon device technology.

(U) **Program Accomplishments and Plans:**(U) **FY 1996 Accomplishments:**

- Developed heterojunction bipolar transistor process, device, and design technologies for application in high-speed analog-to-digital converters, digital-to-analog converters, multiplexers, and demultiplexers. (\$7.2M)
- Delivered the first-generation of hardware and software for advanced image processing. (\$6.3M)
- Completed development of advanced electronic neural network technologies for target tracking and recognition applications. (\$6.5M)
- Developed critical materials, processes, and device technologies for .25µm silicon-on-insulator semiconductor fabrication. (\$8.5M)
- Developed optoelectronics technologies to enable cost-effective fabrication and integration of module subassemblies for digital optoelectronic processors, bus and backplanes, and serial/parallel input/outputs. (\$23.7M)
- Initiated efforts to design radio frequency photonic components for transmission of millimeter waves and microwaves. (\$.6M)

(U) **Mission Description:** Thin film electromagnetic materials have reached a stage of development where specific applications can be identified in electronic devices and circuitry for military systems. Films are deposited and patterned to form electromagnetic components in ways that are similar to, and compatible with, the processes of conventional semiconductor manufacturing. Such electromagnetic components, as well as complementary metal oxide semiconductors (CMOS), work best at lower temperatures, so that cryogenic packaging generally will be required for highest performance. Thin-film high temperature superconducting (HTS) components packaged with cryogenic devices are being applied to radars, electronic warfare suites, and communications systems to enhance performance by more than an order of magnitude while reducing size and power requirements. Particular demonstrations include an upgraded ship-defense radar (SPQ-9B) with 100X greater detectability of missiles in littoral clutter, and a switchable filterbank with 24 individually tuned high-performance filters to suppress Electronic Warfare (EW) saturation in radar warning receivers. Highly dependable and inexpensive cryocoolers (including thermoelectric cryocoolers) are being developed for these applications, and expanded efforts will explore techniques to improve the performance of all solid state thermoelectric coolers as well as the overall cryogenic performance in applications ranging from communications to computing.

(U) **Program Accomplishments and Plans:**(U) **FY 1996 Accomplishments:**

- High Temperature Superconductors/Analog and Digital Applications (\$13.7M): In this final year of the HTS Program, components were evaluated for integration into military avionics.
 - Continued integration of 24-element filterbank with refrigerator for application to F-15 aircraft.
 - Evaluated cryo-radar with HTS stabilized oscillator (STALO), at the Naval Research Laboratory (NRL) Chesapeake Bay Facility.
 - Completed funding for Consortium for Superconducting Electronics.
 - Continued development of a high-performance 8x8 asynchronous transfer mode (ATM) cryogenic switch in a wide area network.
 - Developed simultaneously switchable and tunable high temperature superconducting (HTS) filters, preserving low insertion loss and high quality factors.
 - Examined applicability of 2nd generation HTS filters to interference reduction in communications sets, particularly SINGGARS radios.

greater than present performance, showing capability to detect targets over that range and an ability to address the defense of surface ships to attacking missiles.

- Demonstrate the ability of cryo-filterbanks to provide Electronic Counter-Countermeasures (ECCM) for aircraft receivers, in a scenario to be developed by the Air Force.
- Demonstrate an improved analog to digital (A/D) converter employing cryogenic components.
- Demonstrate low-cost (less than \$2500), highly reliable (greater than 30,000 hr) Sterling cycle cryocooler that delivers 5 watts at 80K with less than 200 watts of total power.
- Thermoelectric Materials and Devices. (\$4.0M)
 - Demonstrate a thermoelectric cooler that will provide a reduction in temperature greater than 50°C in a single stage.

(U) FY 1999 Program:

- Cryogenics Technologies. (\$12.2M)
 - Insert cryogenic packages in communication transceivers which mitigate electromagnetic interference effects.
 - Demonstrate digital waveform generation and signal processing using superconducting quantum devices.
 - Demonstrate pulse tube or Sterling cycle cryocooler costing less than \$1,500 in quantities of 1,000 with greater than 40,000 hr mean time before failure that delivers 5 watts of cooling at 70K with an input power of 150 watts or less.
- Thermoelectric Materials and Devices. (\$6.0M)
 - Demonstrate thermoelectric coolers that can achieve 100°C cooling in less than three stages as compared to the current seven stages.
 - Demonstrate potential benefit of efficient power generation from thermoelectric devices operating at high temperature (>500°C).

Military Medical/Trauma Care Technology MPT-07	27,529	21,127	18,384	17,686	19,554	18,231	17,497	19,764	Continuing	Continuing

(U) **Mission Description:** The objective of this project is to revolutionize far-forward battlefield trauma care. The project recognizes that planned downsizing of U.S. forces creates new pressures to ensure force readiness, skill mix, and effective joint doctrine at a time when battlefield casualties carry both strategic importance and tactical relevance. A review of combat casualty care has shown: (1) that 90% of combat deaths occur in the zone of close combat prior to medical or surgical intervention; (2) that 50% of these deaths are preventable with immediate, effective, correct medical treatment; (3) that casualty location is a continuing battlefield problem; and (4) that less than 5% of U.S. Army active-duty physicians have treated combat casualties.

(U) The DARPA Combat Casualty Care program has two major segments: (1) Advanced Biomedical Technology (ABT) and (2) Ultrasonic Diagnostic Imaging. The ABT segment exploits DARPA's unique leadership role in the electronics and information sciences to project advanced medical and surgical care into the far-forward battlefield area to effect early, successful, clinical intervention. In one thrust, this program will develop lightweight personnel status monitors (PSMs) permitting remote non-invasive clinical diagnosis, casualty localization, and friend or foe identification. The PSM, which would be worn by all soldiers as part of their combat uniforms, is further augmented with low power, secure, wireless communications and a Global Positioning Satellite system (GPS). The PSM would monitor the soldiers' clinical vital signs continuously, but would remain otherwise passive unless either queried by an operational commander or the soldiers' vital signs departed from established clinical norms.

(U) The ABT program will also develop the technology base for early far-forward medical/surgical intervention. Hemorrhage will be controlled by projecting the expertise of a surgeon with remote telepresence surgery. Once early surgical stabilization has been achieved, the patient will be evacuated in a critical care life support for trauma and transport pod (LSTAT) which will function like an autonomous single-patient hospital intensive care unit.

(U) In a third thrust, the ABT program will exploit advanced simulation technology to improve the training of battlefield health care providers and to ensure skill currency. The objectives of this effort are to provide for the virtual representation of human structure and function; ensure near-seamless transition from training to clinical practice; and to permit simulation of combat-casualty medical care within the framework of operational battlefield requirements. The broader impact of whole-body virtual simulation on medical education programs will allow military

Materials and Electronics Technology,
PE 0602712E, Project MPT-07

medical students to integrate traditionally separate academic disciplines and dramatically reduce the need for human cadavers or live animal wounding. New technologies for presenting information and training scenarios will be developed using human interface technologies. Virtual reality was used to prototype medical environments, such as mobile operating rooms, critical care life support for trauma and transport pod (LSTAT) and instruments/equipment inserted into casualty care simulations.

(U) The Ultrasonic Diagnostic Imaging segment will develop high-fidelity diagnostic imaging, particularly in biomedical applications of ultrasound. For example, in conventional ultrasound imaging the medium (i.e., human tissue) is inhomogeneous and scatters the signal, which blurs the image. The processes for developing high-resolution imaging will build upon the emerging technology of adaptive acoustics, the displays of which are intuitive and easily interpreted by the combat medic and physician.

(U) In FY 1996, DARPA concluded funding efforts in advanced healthcare informatics. This thrust was developing technology for an advanced healthcare information infrastructure to support the trauma care technology base.

(U) This work does not duplicate any efforts of the Military Services or the National Institutes of Health. A Memorandum of Agreement exists between the Army Medical Department and DARPA.

(U) Program Accomplishments and Plans:

(U) FY 1996 Accomplishments:

- Advanced Biomedical Technology. (\$16.8M)
 - Developed a specialty version of the Personnel Status Monitor (Ranger Overwatch PSM) with temperature, heart rate and motion sensors for insertion into Army Ranger training exercises.
 - Completed first prototype limb trauma simulator and delivered to U.S. Army Special Operations Command (USASOC) Medical Training facility.
 - Completed design and feasibility study to incorporate trauma simulator into the medic training on the virtual battlefield at the Dismounted Warrior Battle Lab (DWBL).
 - Completed 7 degrees of freedom (DOF) end-effectors and wireless communication packages for Remote Telepresence Surgery System.
 - Completed and delivered first prototype of life support for trauma and transport (LSTAT).
- 3-D Ultrasound Technologies. (\$2.1M)
 - Developed prototype battlefield/trauma ultrasonic imager technology (using a 2D array equivalent) for 3D interpretation of body structures for insertion into Bosnia as a battlefield tele-ultrasound unit.

- Continued development of processing techniques taken from synthetic aperture radar to determine those features which are pertinent to the ultrasonic imaging problem. Began testing algorithms which could mitigate the contribution of multiple scattering sites to image degradation.
- Healthcare Information Infrastructure. (\$6.2M)
 - Integrated models of combat doctrine and knowledge-based decision support tools (combat casualty protocols and guidelines) in support of combat medics and physicians.
 - Demonstrated hands-free capture of patient data under battlefield conditions.
 - Demonstrated integration of battlefield electronic patient record with peacetime care systems.
- Bio Detection and Identification. (\$2.4M)
 - Continued development of ionization source and curved-field reflectron for tiny time-of-flight mass spectrometer.
 - Conducted preliminary exploration of approaches to transect and characterize the induced genetic changes in stem cells or their derivative lineages for the purpose of potential defense against biological weapons.

(U) FY 1997 Program:

- Advanced Biomedical Technology. (\$16.6M)
 - Develop and demonstrate respiration sensor for Personnel Status Monitor (PSM) and validate medical algorithm.
 - Develop sensate liner for identifying penetrating wounds.
 - Incorporate full haptic interface (sense of touch) into limb trauma simulator, phase one of organ system surgical simulation, and integrate medic simulation into Dismounted Warrior Battle Labs (DWBL).
 - Develop interchangeable surgical tools for remote telepresence surgery and explore methodology for motion compensation (e.g., beating heart); insertion of beta version of Life Support for Trauma and Transport (LSTAT).
 - Integrate micro-miniaturized components (ventilation, oxygen generator, monitors, power units) into beta version LSTAT with canopy. Demonstrate 3rd generation design of LSTAT which is NATO compatible.
- 3-D Ultrasound Technologies. (\$4.5M)
 - Continue to develop and implement the techniques of adaptive acoustics to ultrasonic imaging, utilizing 2-D sensor arrays and image processing.
 - Demonstrate battlefield tele-ultrasound unit in Bosnia, linking an Army field hospital in Bosnia with an Army hospital in Germany.

- (U) **Mission Description:** The Advanced Electronics Technology program element is budgeted in the Advanced Technology Development Budget Activity because it seeks to design and demonstrate state-of-the-art manufacturing and process technologies for the production of various electronics and microelectronic devices, sensor systems, actuators, and gear drives that have both commercial and military applications. Introduction of advanced product design capability and flexible, scalable manufacturing techniques will enable the commercial sector to rapidly and cost-effectively satisfy military requirements and enhance the U.S. industrial base.
- (U) The IR Focal Plane Array project focuses on the establishment of a manufacturing capability for advanced infrared sensor arrays for major weapons systems. This industrial base will allow the systems to meet specification requirements at approximately 1% of the current cost.
- (U) The Electronic Module Technology project is a broad initiative to substantially decrease the cost and increase the performance of weapon systems through the timely insertion of state-of-the-art electronic modules. Electronic module technology addresses the design and fabrication of various types of digital, analog, and mixed signal modules consisting of electronic, electro-optical and micro-mechanical components. It includes traditional approaches such as printed circuit boards and emerging technologies such as high density Multichip Modules (MCMs).
- (U) The Tactical Information Systems project contains three major programs: Head Mounted Displays (HMD), Smart Modules, and Warfighter Visualization. The Head Mounted Display program is developing world-class miniature displays and integrating these displays into head and helmet mounted configurations for use by pilots, combat vehicle crews and individual warriors as well as for virtual environments and simulation. Smart Modules is a program to design and develop prototype modules, using core technologies that sense, think, and communicate, and integrate them into selected personal information products. Warfighter Visualization is a program to demonstrate the feasibility of combining real-time visual images of the environment with geospatially registered computer generated information for use by individual mounted and dismounted warfighters.
- (U) The Microwave and Analog Front End Technology (MAFET) project is the only DoD effort directed at significantly reducing non-recurring costs for military microwave/millimeter wave sensor systems through improved computer aided design capabilities. It will provide urgently needed improvements in the performance and affordability of microwave and millimeter wave components. The MAFET program addresses the essential foundation for all DoD systems and programs making use of microwave and millimeter wave solid state technology.
- (U) The Centers of Excellence project finances demonstration, deployment of and training on advanced manufacturing technologies. The goal of this technology is to reduce unit and life-cycle costs while improving quality.

Advanced Electronics Technologies,

PE 0603739E

(U) The goal of the Manufacturing Technology Applications project is to reduce the cost and acquisition leadtime of future military systems by integrating manufacturing process considerations during the product design phase, and by demonstrating high efficiency multi-product prototype factories. This project will also enable manufacturers to economically produce military variants of their commercial products in limited quantities through the introduction of flexible process technologies.

(U) Advanced Lithography technology has enabled the dramatic growth of integrated circuit capability. Advances have led directly to improvements in electronic and computing systems performance in terms of speed, power, weight and reliability.

(U) The mission of the Electronic Commerce Resource Centers project is the transfer of electronic commerce technologies to small- and medium-size enterprises through a network of regional deployment centers. This program will transition to the Defense Logistics Agency as of FY 1998.

(U) The Microelectromechanical Systems (MEMS) project was previously included in MT-04, the Electronic Module Technology Project. This program is a broad and cross-disciplinary initiative to develop an enabling technology that merges computation with sensing and actuation to realize new systems for both perceiving and controlling weapons systems, processes and battlefield environments. Using fabrication processes and materials similar to those that are used to make microelectronic devices, MEMS conveys the advantages of miniaturization, multiple components, and integrated microelectronics to the design and construction of integrated electromechanical systems. The microfluidic molecular systems program will address issues centered around the development of automated microsystems that integrate biochemical fluid handling capability along with electronics, opto-electronics and chip-based reaction and detection modules to perform tailored analysis sequences for monitoring of environmental conditions, health hazards, and physiological states.

COST (In Thousands)	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	Cost to Complete	Total Cost
IR Focal Plane Array MT-03	39,493	23,076	9,000	11,000	3,000	0	0	0	0	N/A

(U) **Mission Description:** The Infrared Focal Plane Array project addresses the technology necessary to produce affordable, infrared (IR) sensor arrays, essential to major weapon systems. The focal plane array consists of a two dimensional detector array sensitive in a broad spectral range, integrated with unique signal processing to enhance performance and provide more efficient utilization of the information. The critical elements of the technology addressed in this program include the infrared material, detector array fabrication, read-out electronics, cryogenic packaging and testing, and module assembly. Processing and fabrication techniques focus on the production of affordable arrays, at low volume, in the configurations required by weapon systems. Performance enhancements in uncooled infrared and near-infrared sensors are also being addressed to provide an integrated, broadband two dimensional sensor array without the cryogenic package usually associated with infrared sensors. Elimination of the cryogenic package dramatically reduces the cost of the sensor module, and provides a sensor package compatible with a wide range of system applications, including navigation, targeting and manportable systems. The solid state integrated sensor also solves the problem of blooming in the presence of high intensity sources, which is encountered with current low light level visible and near infrared sensors. Arrays will be built in the configuration required for missile seekers; target acquisition and navigational platforms; search and track; and threat warning systems.

(U) **Program Accomplishments and Plans:**(U) FY 1996 Accomplishments:

- Completed development of standard electronic cells for rapid design and fabrication of infrared read-out circuits. (\$9.0M)
- Demonstrated uncooled focal plane arrays hybridized to low noise analog readout circuits. (\$5.0M)
- Demonstrated focal plane array fabrication using four inch diameter silicon wafers. (\$14.0M)
- Verified computer aided design tool for infrared sensors; including cryogenic packaging. (\$11.5M)

(U) FY 1997 Program:

- Complete single-wafer IRFPA processing on six inch silicon wafers. (\$6.0M)
- Demonstrate capability to fabricate uncooled infrared sensor with one million pixels. (\$5.5M)
- Assess capability to fabricate thin film ferroelectric uncooled infrared sensor. (\$4.0M)
- Evaluate imaging performance and anti-blooming of uncooled solid state sensor. (\$7.6M)

COST (In Thousands)	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	Cost to Complete	Total Cost
Electronic Module Technology MT-04	92,976	59,716	64,726	94,090	125,160	125,312	127,240	132,425	Continuing	Continuing

- (U) **Mission Description:** The Electronic Module Technology Project is a broad initiative to substantially decrease the cost and increase the performance of weapon systems through the timely insertion of state-of-the-art electronic modules. Electronic module technology addresses the design and fabrication of various types of digital, analog, and mixed signal modules consisting of electronic, electro-optical and micro-mechanical components. It includes traditional approaches such as printed circuit boards and emerging technologies such as high density Multichip Modules (MCMs).
- (U) The project has four major objectives: (1) shorten the overall design, manufacture, test, and insertion cycle for advanced electronic subsystems; (2) advance the state-of-the-art in electronic interconnection and physical packaging technology to allow circuits to operate close to their intrinsic maximum speed with less overhead in terms of volume, weight and cost; (3) provide a robust manufacturing infrastructure for electronic modules; and (4) demonstrate the system level payoff of electronic module technology through advanced technology demonstrators (ATDs).
- (U) The project has the following major elements: Application Specific Electronic Modules (ASEM); Multichip Integration (MCI); Rapid Prototyping of Application Specific Signal Processors (RASSP); Optical Micro-Networks (OMNET); Cooperative Adaptive Payloads (CAPS); Infrared Artificial Dielectrics (IRADs); and Design Support for mixed Technology Integration (Composite CAD). ASEM will reduce the non-recurring engineering time and cost for designing and inserting complex electronic modules. MCI will produce order of magnitude reductions in manufacturing cost and accelerate the acceptance and insertion of Multichip Integration technologies. RASSP is a major DARPA/tri-Service initiative which seeks to dramatically reduce the development time and life cycle cost of advanced signal processing capability. OMNET seeks to demonstrate new paradigms for integrating electronic, electromechanical, and electro-optical components to enable small, lightweight, battlefield information systems. Distributed Robotics is a new effort to integrate developments in MEMS, power sources, communications, and advanced microelectronics to design, construct and field multiple, high-performance, mobile, autonomous systems. Composite CAD seeks to enable the design of systems incorporating emerging micro-devices and manufacturing processes by developing the design technology (tools, methodology, and architectures) to support device and systems design of mixed-technology integrated systems.

(U) Program Accomplishments and Plans:(U) FY 1996 Accomplishments:

- Completed development of required microwave packaging approaches and interconnection circuitry; produced and demonstrated required multichip microwave assemblies. (\$10.0M)
- Demonstrated complete end-to-end Rapid Prototyping of Application Specific Signal Processors (RASSP) design framework with additional demonstration hardware and benchmark evaluations. Developed accelerated framework standards, improved Computer Aided Design (CAD) technology for system testing, and reuse libraries. Accelerated technology transfer activities. (\$32.2M)
- Continued Application Specific Electronic Modules (ASEM) program to reach one month turn-around time and \$25K non-recurring engineering (NRE) cost for digital Multichip Modules (MCMs). Demonstrated high volume production technology for producing known-good die. (\$19.6M)
- Continued Multichip Integration (MCI) program with the delivery of high volume/low cost laminate MCM technology and developed optimized modules and mixed signal applications. (\$20.1M)
- Expanded the current effort in Seamless High Off-Chip Connectivity (SHOCC) to include a full scale demonstration of a high-performance microprocessor. This demonstration segmented the integrated circuit design into yield and performance-optimized active elements, fabricated these elements and assembled a fully-functional device on a passive substrate incorporating traces formerly within the chip. Mating of the active die to the substrate was through a high-density interposer. (\$9.6M)
- Reprioritized design activities to focus on enabling highly integrated mixed-technology electronic systems which include digital, analog, MEMS and optics devices. (\$1.5M)

(U) FY 1997 Program:

- Complete and demonstrate final end-to-end RASSP signal processor design environment. Complete technology insertion demonstrations, benchmarking analysis, and technology transition activities. (\$7.2M)
- Continue ASEM technology development and demonstrate new ASEM foundry capability for flexible production of modules with board-level integration. (\$11.8M)
- Continue Multichip Integration program to demonstrate order of magnitude reductions in MCM manufacturing costs and MCM technology insertions. Continue insertion of MCM technology into dual-use products such as workstations, engine control and wireless communications. (\$22.6M)
- Initiate OMNET program to demonstrate new paradigms for integrating electronic, electromechanical, and electro-optical components to enable small, lightweight, battlefield information systems. (\$9.1M)

- Continue to refocus ASEM and MCM design technology to support the design of composite electronic systems from composable design tools (electronics composite CAD). Focus on multi-technology lumped behavior modeling capability. (\$4.3M)
 - Leverage ongoing design efforts to enable design of highly integrated MEMS devices coupled with electronics through the development of coupled energy modeling of 3D devices (MEMS and optics composite CAD). (\$4.7M)
- (U) FY 1998 Program:
- Complete ASEM program to reduce non-recurring engineering cost for designing and inserting multi-chip modules. (\$4.0M)
 - Complete the Multichip Integration (MCI) program to improve substrate fabrication, demonstrate reductions in Multichip Modules (MCM) manufacturing costs, and technology insertions. (\$14.3M)
 - Optical Micro-Networks (OMNET) - Downselect amongst heterogeneous integration technologies and demonstrate multi-functional integration of electronic, electro-mechanical and optoelectric components targeted to military information systems. (\$12.7M)
 - Distributed Robotics - Initiate effort to put together in one package low-weight (<2 kg), high-performance payloads including sensors, imagers, countermeasures, designators, communications, and munitions. (\$8.0M)
 - Composite CAD - Integrate a composable design capability for single chip electronics and MEMS systems. Develop models with parameters optimized for manufacturing variances. Initiate behavior modeling of mixed technology devices. (\$17.0M)
 - Molecular-level, Large-area Printing (MLP) - Establish preliminary micro-molding process using commercially available (CD manufacturing) tool; initiate studies of alternative micro-printing processes (letterpress, gravure, tropomorphic). (\$8.7M)

(U) FY 1999 Program:

- OMNET - Demonstrate integrated optoelectronic transceivers and optical switches for reconfigurable interconnections of sensors to processors and the ability to distribute computation across military platforms 1-100 meters in length for future Electronic Warfare/digital radar and image processors. (\$18.0M)
- Distributed Robotics - Construct the unit platforms, integrate commercial or demonstrated technology elements (e.g., imagers, MEMS, wireless systems), and field packs/herds of units to demonstrate multiple, cooperative functions. (\$19.0M)
- Composite CAD - Continue to develop the mixed domain (kinematic, electric, electrostatic, and fluidic) analysis of micro-machined devices, systems of devices and corresponding electronic circuits to support the design of composite electronic sensors and systems. (\$18.0M)

(U) **Mission Description:** This project is a major DoD effort to develop the technology for displays and portable information systems for use in a variety of military systems. The project has three major efforts: Head Mounted Displays (HMDs), Smart Modules, and Warfighter Visualization. The Head Mounted Displays develops world-class miniature displays and integrates these displays into head and helmet mounted configurations for use by pilots, combat vehicle crews and individual warriors as well as for virtual environments and simulation. Smart Modules designs and develops prototype modules, using core technologies that sense, think, and communicate, and integrate them into selected personal information products. Warfighter Visualization demonstrates the feasibility of combining real-time visual images of the environment with geospatially registered computer generated information for use by individual mounted and dismounted warfighters.

(U) **Program Accomplishments and Plans:**(U) **FY 1996 Accomplishments:**

- Completed all on-going miniature display efforts and initiated feasibility demonstrations for miniature diffraction grating displays and Microelectromechanical Systems (MEMS) based displays. (\$10.1M)
- Demonstrated four systems for use by individuals remotely located from conventional information sources. Initiated developments to demonstrate individually worn direction finding and video capture capability. (\$10.6M)

(U) **FY 1997 Program:**

- Demonstrate feasibility of diffraction grating and MEMS based miniature displays. Diffraction grating displays will integrate drivers, standard interfaces, memory and controller circuitry directly on the display. This will improve the range of applications for which the display can be applied and significantly reduce power consumption requirements. The MEMS display will use a novel micro-beam steering device to control the movement of a fiber optic to scan a mirror with an image. This type of display will greatly reduce the head-borne weight to a few ounces and significantly reduce power consumption over currently available displays. (5.7M)

be able to be worn by individual soldiers and communicate via a radio to and from geographic information system data bases. (\$9.2M)

- Demonstrate a wearable computer incorporating wireless communication in a one pound, one watt configuration. This represents a 3x improvement in weight and a 10x improvement in power over current technology. The wearable computer will be used in a wide variety of applications by the small unit operations soldier. (\$9.0M)
- Demonstrate prototype capability for dismounted soldiers to view the real world with overlaid graphic symbology. This capability will allow the soldier to receive visual information that is relevant to his/her mission time or location. It will also allow the soldier to interrogate databases containing information about the specific objects in his/her viewing environment. (\$5.8M)
- Demonstrate prototype "see-through" tank concept. This capability will allow a "buttoned-up" tank crew wearing head mounted displays to view the outside world as though the tank were made of glass. This will be accomplished by placing cameras on the outside of the tank that provide inputs to a mapped memory. Images will be fed to the users head mounted display depending upon the direction that the user is looking. This capability will significantly enhance the situation awareness of the tank crew. (\$6.5M)
- Demonstrate a capability to obtain one-dimensional and two-dimensional data from a submarine sensor suite and configure these data into a 3-dimensional image covering 360 degrees that is provided to a head tracked, head mounted display. This capability will be used by a submarine conning officer to demonstrate an enhanced capability for under ice submarine navigation. (\$5.1M)

Microwave and Analog Front End Technology MT-06	41,665	41,234	28,019	13,183	1,000	0	0	0	0	N/A	
<p>(U) Mission Description: Microwave and millimeter wave technology for DoD electronic weapon systems is at a critical crossroads. Great progress has been made under the microwave and millimeter wave integrated circuit (MIMIC) program in terms of maturing the gallium arsenide industrial community. The DoD is now far ahead of the commercial world in microwave and millimeter wave technology in terms of performance characteristics. However, in many cases, radio frequency (RF) sub-system costs are still a major impediment to fielding DoD weapon systems. Material, processes and design technology advances must be undertaken to sustain an effective defense capability and to maintain U.S. dominance in this critical technology area. The Microwave and Analog Front End Technology (MAFET) program is the only DoD effort directed at significantly reducing non-recurring costs for military microwave/millimeter wave sensor systems through improved computer aided design capabilities and advanced technologies. It will provide urgently needed improvements in the performance and affordability of microwave and millimeter wave components. The MAFET program addresses the essential foundation for all DoD systems and programs making use of microwave and millimeter wave solid state technology.</p> <p>(U) Specifically, the MAFET program will provide the DoD with the state-of-the-art electronic systems that it needs to maintain its force multiplying capability. The program will: (1) reduce design time and cost for every RF system being developed or upgraded through an improved microwave/millimeter wave design environment; (2) break the very expensive cycle and time-consuming current practice of design-build-test--redesign-rebuild-retest; (3) put in place repeatable, robust processes to produce high frequency components; (4) make strategic investments in critical passive, packaging and integrated circuits devices needed for millimeter wave systems; and (5) investigate revolutionary solutions to the long-standing problem of insufficient power in solid-state radar and communications transmitters.</p> <p>(U) Program Accomplishments and Plans:</p> <p>(U) FY 1996 Accomplishments:</p> <ul style="list-style-type: none"> Continued development and implementation of microwave/millimeter wave computer aided design (CAD) environment with quantitative demonstration of ability to reduce time and cost of producing microwave and

(U) FY 1998 Program:

- Complete microwave/millimeter wave computer aided design environment. Demonstrate design environment effectiveness. Continue implementation of Microwave Hardware Description Language (MHDL). (\$9.5M)
- Complete advanced sensor technology developments in the areas of: advanced fabrication, packaging, and multichip assembly (MCA) foundries. In the fabrication area, demonstrate: (1) production InP HEMT and HBT millimeter wave processes; (2) advanced manufacturing processes for: High power and high efficiency, and high dynamic range, capability; and (3) highly manufacturable and reliable HBT high power amplifiers. In the packaging area, demonstrate: (1) a 10x cost reduction in plastic HDI module fabrication technology; and (2) a 7x RF interconnect/package reduction due to embedded transmission lines and advanced multilayer interconnect. In the foundry area, demonstrate a 5x reduction in MCA production cost. (\$7.9M)
- (1) In novel high-power transistor area, demonstrate 5-W SiGe HBT solid-state power amplifier (SSPA) having near-50% power-added efficiency (PAE) at X-band; Demonstrate 10-W GaN MODFET having PAE=50% in X band; Demonstrate 25-W SiC MESFET having PAE=45% in X band. (2) In quasi-optics area, continue development of solid-state quasi-optical Ka-band sources with high output power and high coherence; Complete and demonstrate numerical design tool. (3) In MEMS-switch area, demonstrate 4-bit true-time-delay phase shifter in (a) X-Band with 2-dB total loss, and (b) Ka-Band with 3-dB loss; Demonstrate 20/44-GHz dual-frequency MEMS-switched planar antenna. (4) In micromachined circuits and novel thermal management area, demonstrate micromachined W-band Wilkinson combiners in Si substrates; Demonstrate Flourinert cooling of a 10-W X-band MMIC and a 1-W Ka-band MMIC. (\$10.6M)

(U) FY 1999 Program:

- In quasi-optics area, demonstrate a set of quasi-optical grid-, array-, card-, and slab-combined power amplifiers including (a) a 100-W 50%-PAE card amplifier at 10 GHz, (b) a 20-W-output >25%-PAE array amplifier at 35 GHz, (c) a 20-W-output 15-to-20%-PAE grid amplifier at 40 GHz, (d) a 10x10-element 10-W electronically-steerable array amplifier at 44 GHz, and (e) a 5-W 20%-PAE slab-amplifier at 94 GHz. (\$5.6M)
- In novel high-power-transistor area, demonstrate 100-W-output GaN and SiC SSPAs operating across X band. (\$2.9M)
- In MEMS-switch area, demonstrate MEMS-tunable Chebyshev filter operating at 20 and 45 GHz; Demonstrate MEMS-array transmitting beam-steerer at 44 GHz. (\$2.9M)
- In micromachined circuits and novel thermal management area, demonstrate a micromachined SSPA ("W-Band Power Cube") having 2 W/in² intensity radiated from top facet. The power cube will be fabricated with InP Power MMICs that are thermally managed by bump bonding and are coupled to free space by Si-micromachined feed-line and planar-antenna structures. (\$1.8M)

(U) **Mission Description:** This project provides funding for Centers of Excellence including the Robert C. Byrd Institute for Advanced Manufacturing at Marshall University, and the Focus: HOPE National Center for Advanced Technologies (NCAT). The purpose of these Centers is to demonstrate, deploy and provide advanced manufacturing technology to significantly reduce unit production and life cycle costs, improve product quality, and deploy manufacturing training systems.

(U) The Institute for Advanced Flexible Manufacturing provides both a teaching factory and initiatives to local area industries to utilize computer-integrated manufacturing technologies and managerial techniques to improve productivity and competitiveness. The National Center for Advanced Technology (NCAT) is a component of the Focus: HOPE Project whose purpose is to train technicians/engineers in advanced manufacturing processes and methods, demonstrate state-of-the-art flexible manufacturing and serve as a testbed for emerging manufacturing research.

(U) This project also includes funding in FY 1997 for the U.S.-Japan Management Training Program whose purpose is to build a growing infrastructure of American scientists and engineers with knowledge about the Japanese R&D enterprise and provide training in the Japanese language.

(U) **Program Accomplishments and Plans:**(U) **FY 1996 Accomplishments:**

- Focus: HOPE. (\$12.9M)
 - Developed software to integrate 3D computer models with numerically controlled machine tools, and demonstrated its production capability.
 - Demonstrated an electronic (digital) library in the context of education and training of machinists.
- Institute for Advanced Flexible Manufacturing. (\$3.9M)
 - Developed, demonstrated and evaluated new technologies for insertion and transfer to manufacturing centers and industry with a focus on small- to medium-sized manufacturing companies.

COST (In Thousands)	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	Cost to Complete	Total Cost
Manufacturing Technology Applications MT-08	59,336	32,201	32,355	25,200	21,951	0	0	0	0	N/A

(U) **Mission Description:** Future military systems will be affordable only if the manufacturing process is considered as an integral part of product design, production takes place in flexible, multi-product factories, and if advanced manufacturing technology is combined effectively with advanced business practices. This program focuses on demonstrations of process technology combined with innovative product areas. Three major initiatives are included in the in cost, schedule and quality achievable in key defense product areas. Three major initiatives are included in the FY 1996-2000 program: Affordable Multi-Missile Manufacturing (AM3); Agile Manufacturing Pilot Programs; and the DARPA/Tri-Service Flexible Interferometric Fiber Optic Gyroscope (IFOG) Manufacturability Program.

(U) The Affordable Multi-Missile Manufacturing (AM3) program is an Advanced Technology Demonstration initiated in FY 1995. The objective of AM3 is to demonstrate the feasibility of 25-50% reductions in the unit cost of tactical missiles, both in ongoing missile production programs and in new missiles and major modifications. This will be accomplished by teams of missile prime contractors, component suppliers and manufacturing equipment and software vendors who develop and demonstrate the combined effects of advanced design, manufacturing, assembly systems and processes, missile value engineering changes, and acquisition reform and business practice innovations. A major technical theme is to achieve economies across a mix of missiles to compensate for the decline in individual missile quantities. Demonstrations will be conducted in the design and manufacture of components and guidance and control/seeker assemblies for multiple missiles, including R&D and production programs.

(U) Agile Manufacturing is an industry-developed vision for 21st century manufacturing, which focuses on the ability to thrive in an environment of changing product technologies, customer demands, and development and production team members. This new paradigm is ideally suited to the needs of defense manufacturing in the future. Agile Manufacturing Pilot Programs are structured to evaluate the manufacturing enterprise concepts and enabling technology required for agility on and above the factory floor. Since over 50% of the cost of weapon systems is attributable to components from lower tier suppliers, the major emphasis is on tightly integrating the supplier chain and other elements of the manufacturing enterprise.

(U) Interferometric Fiber Optic Gyroscopes (IFOG) are emerging as preferred technology for future military and commercial inertial navigation applications. The emphasis of the IFOG Manufacturability Program is on achieving the

RDT&E BUDGET ITEM JUSTIFICATION SHEET (R-2 Exhibit)

design and manufacturing flexibility required to make low volume Defense components economically viable when compared to high volume commercial production. This program will develop the large throughput robotic assembly, packaging and testing technologies necessary to fabricate navigation-grade (0.01 deg/hr) Interferometric Fiber Optic Gyroscopes (IFOGs) at less than \$1,500 per axis as a goal. This will enable affordable, accurate (1nm/hr) inertial navigators for use during extended periods of Global Positioning System (GPS) signal outage due to enemy jamming or signal obscuration. Flexible manufacturability enables, from the same production line, fabrication of navigation grade, military tactical grade (0.1 - 1.0 deg/hr) IFOGs and lower performing (> 1 deg/hr) commercial IFOGs. Example technology development areas include: (1) low loss, low reflectivity, polarization-preserving optical connections between optical fiber subassemblies, optical sources, detectors and miniature integrated optical circuits; (2) rapid, precision coil winding machines; (3) geometrically stable, environmentally robust (temperature and vibration) packaging of critical optical subassemblies; and (4) automatic testing machines. Phase 1 identified IFOG manufacturing process requirements for components, subassemblies and complete IFOG units. Phase 2 will demonstrate advanced manufacturing methods, controls and equipment.

(U) Program Accomplishments and Plans:(U) FY 1996 Accomplishments:

- Affordable Multi-Missile Manufacturing (AM3). (\$23.7M)
 - Completed Affordable Multi-Missile Manufacturing (AM3) Phase 1, approved validation plans, and initiated Phase 2 demonstrations to assess and mitigate risks, including simulation and modeling, design and component-level manufacturing demonstrations, and qualification testing.
 - Competitively selected two system vendors for the development of supply chain integration technologies to fill gaps identified in AM3 Phase 1.
 - Continued AM3 technical integration activities, conducted independent evaluation of contractor cost savings analyses and completed initial set of benchmark comparison studies for the missile sector.
- Agile Manufacturing Program. (\$16.2M)
 - Completed Agile Manufacturing business practice demonstrations and documentation, inserted results in Pilot Program testbeds, and disseminated results for DoD and industry implementation.
 - Completed Agile Manufacturing enabling technology demonstrations, initiated beta test in Pilot Programs, and transferred technology through the Industry Forum and through vendor products.
 - Completed Agile Manufacturing pilot programs in space launch vehicles and castings.
 - Continued Agile Manufacturing industry forum activities, including delivery of agility tool kit and knowledge base, and transition to self-sustainment.

- Interferometric Fiber Optic Gyroscope (IFOG). (\$19.4M)
 - Developed and implemented manufacturing processes for coil winding and optical components/subassemblies.
 - Completed IFOG architectures and began to develop and implement manufacturing processes.

(U) FY 1997 Program:

- Affordable Multi-Missile Manufacturing (AM3). (\$11.8M)
 - Complete AM3 Phase 2 component-level validation demonstrations.
 - Competitively select at least two pilot enterprises for AM3 Phase 3, and initiate cost-shared implementation and demonstration of concepts and technology across the target missile mix.
 - Initiate first demonstrations of supply chain technologies to fill gaps identified in AM3 Phase 1 and continue technical integration and independent cost analysis.
- IFOG. (\$20.4M)
 - Evaluate wound coils and packaged subassemblies for IFOG.
 - Continue to implement brassboard Interferometric Fiber Optic Gyroscopes (IFOG) unit manufacturing processes.
 - Deliver superluminescent optical sources.

(U) FY 1998 Program:

- Affordable Multi-Missile Manufacturing. (\$26.2M)
 - Continue AM3 Phase 3 implementation of new factory systems and new business practices in at least two pilot enterprises.
 - Complete initial design and test planning for AM3 multi-missile components and value engineering change proposals.
 - Complete initial demonstrations of supply chain technologies to fill gaps identified in AM3 Phase 1, and continue technical integration and independent cost analysis.
- IFOG. (\$6.2M)
 - Demonstrate flexible production of navigation grade and tactical grade IFOG units.
 - Demonstrate production of high power, stable, packaged optical sources, low cost couplers and wavelength division multiplexers.

(U) FY 1999 Program:

- Affordable Multi-Missile Manufacturing. (\$25.2M)

COST (In Thousands)	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	Cost to Complete	Total Cost
Advanced Lithography MT-10	57,154	62,704	32,000	32,000	32,000	32,000	32,500	30,754	Continuing	Continuing

(U) **Mission Description:** Lithography technology has enabled the dramatic growth in microelectronics capability over the past three decades and microelectronics is a key to improved weapon system performance. The improved capabilities in semiconductor technology contribute to significant system gains in speed, reliability, cost, power consumption, and weight. Advanced microelectronics technology is essential for computing and signal processing throughout essentially all military systems, including command, control, communications, and intelligence, electronic warfare, and beam forming for radar and sonar. Further improvements in areas such as target recognition, autonomous guided missiles, and digital battlefield applications require microcircuits with smaller features to meet the operational speed, power, weight and volume constraints of these systems.

(U) Current microelectronics fabrication utilizes feature sizes of 0.35 microns. The Advanced Lithography Program emphasizes longer term research with expected high payoff in the fabrication of semiconductor devices with 0.1 or less micron feature sizes. These programs will develop technology for sub 0.1 micron features. Current programs in cross-cutting technologies (mask, stages, resists, metrology) and x-ray lithography will be completed in one - two years. Key subsystems of the maskless e-beam developments will be demonstrated late in the decade.

(U) **Program Accomplishments and Plans:**(U) **FY 1996 Accomplishments:**

- Demonstrated prototype projection electron-beam and ion-beam lithography lenses. (\$10.0M)
- Demonstrated processing using x-ray lithography and point source development. (\$23.0M)
- Developed alignment sub-assemblies and mask technology for 0.18 micron lithography system. (\$13.0M)
- Developed key subsystems for a point source x-ray lithography system. (\$11.2M)

(U) **FY 1997 Program:**

- Demonstrate full-chip stitching for e-beam projection (SCALPEL) and initiate maskless lithography efforts. (\$10.0M)
- Install process for using tantalum absorber on SiC membrane for x-ray mask and demonstrate solid-state power supply for dense plasma focus source. (\$42.0M)
- Demonstrate 25 wafers per hour throughput for synchrotron stepper and demonstrate gas-field ion source test column for mask repair. (\$10.7M)

(U) **Mission Description:** The mission of this program is the transfer of electronic commerce (EC) technologies to small- and medium-size enterprises (SMEs) through a network of regional deployment centers. This mission is a subset of the overall DoD plans for Continuous Acquisition and Life-cycle Support (CALS) and for electronic commerce as part of Acquisition Reform. To reflect the focus on that subset, the program name was changed in FY 1994 from CALS Shared Resource Centers to Electronic Commerce Resource Centers (ECRCs). The regional ECRCs provide training and technical assistance to aid SMEs in defense supply chains in making effective use of electronic commerce and CALS technologies. An ECRC technology hub has been established to keep abreast of EC technologies and to ensure that technical consultants in the regional ECRCs are equipped with the latest information and training on EC technologies. This program will be transitioned to the Defense Logistics Agency at the end of FY 1997.

(U) **Program Accomplishments and Plans:**(U) **FY 1996 Accomplishments:**

- Electronic Commerce Resource Centers (ECRC). (\$31.1M)
 - Follow-on contracts awarded to current ECRC integrators to continue ECRC network of sites for nationwide delivery of education, training, and technical support services (Congressional direction).
 - Continued Technology Hub operations with initiatives for Electronic Commerce (EC) Testbed, and for advances in tools needed for development of Standard for the Exchange of Product (STEP) data model applications.

(U) **FY 1997 Program:**

- Electronic Commerce Resource Centers (ECRC). (\$34.3M)
 - Open five new ECRCs.
 - Complete DARPA funded ECRC technology development and deployment.
 - Transition program to the Defense Logistics Agency (DLA) for continued operation.

(U) **FY 1998 Program:** N/A

COST (In Millions)	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	Cost to Complete	Total Cost
Microelectromechanical Systems (MEMS) MT-12	30,435	62,238	72,060	71,549	69,281	60,000	50,000	50,000	Continuing	Continuing

(U) **Mission Description:** The Microelectromechanical Systems (MEMS) program is a broad, cross-disciplinary initiative to develop an enabling technology that merges computation with sensing and actuation to realize new systems for both perceiving and controlling weapons systems, processes and battlefield environments. Using fabrication processes and materials similar to those that are used to make microelectronic devices, MEMS conveys the advantages of miniaturization, multiple components, and integrated microelectronics to the design and construction of integrated electromechanical systems. The MEMS program addresses issues ranging from the scaling of devices and physical forces to new organization and control strategies for distributed, high-density arrays of sensor and actuator elements. The microfluidic molecular systems program will address issues centered around the development of automated microsystems that integrate biochemical fluid handling capability along with electronics, opto-electronics and chip-based reaction and detection modules to perform tailored analysis sequences for monitoring of environmental conditions, health hazards, and physiological states.

(U) The MEMS program has three principal objectives: The realization of advanced devices and systems concepts; the development and insertion of MEMS products into DoD systems; and the creation of support and access technologies to catalyze a MEMS technology infrastructure. These three objectives cut across a number of focus application areas to create revolutionary military capabilities, make high-end functionality affordable to low-end systems, and extend the operational performance and lifetimes of existing weapons platforms. The major technical focus areas for the MEMS program are: 1) inertial measurement; 2) fluid sensing and control; 3) electromagnetic and optical beam steering; 4) mass data storage; 5) chemical reactions on chip; 6) electromechanical signal processing; 7) active structural control; 8) analytical instruments; and 9) distributed networks of sensors and actuators.

(U) Accomplishments to date include: A wind-tunnel test of an integrated MEMS sensor and actuator array distributed along the leading edge of a model aircraft wing creating rolling moments of sufficient strength to control aircraft flight, pointing the way to future fighter aircraft with advanced maneuverability unattainable using conventional, large and discrete control surfaces; a demonstration of a MEMS-based accelerometer capable of surviving and operating in the near 100,000 G accelerations generated by firing artillery shells, making possible affordable guidance systems to what are presently unguided munitions and increasing both their effectiveness and life cycle costs; and the establishment of a regularly scheduled, shared, MEMS fabrication service for domestic DoD, commercial

and academic users. The service has lowered barriers to access and has allowed hundreds of researchers, students and industrial users, nearly half for the first time, to inexpensively and rapidly fabricate MEMS devices.

(U) Program Accomplishments and Plans:(U) FY 1996 Accomplishments:

- Achieved factor of 3-5x increase in electronics-to-mechanics integration ratios with new fabrication processes; began development of related information-driven and fault-tolerant designs for devices; began incorporation of extreme condition materials into sensor and actuator designs. (\$6.9M)
- Achieved 200-300 mechanical components/sq cm systems densities with associated increases in both process yields and device performance uniformities; began exploration of new organization and control strategies for multiple, heterogeneous and distributed MEMS components; continued development of complete and stressing MEMS systems demonstration projects in areas such as fluid vortex control, adaptive optics, combustion control and atomic-resolution mass-data storage. (\$16.4M)
- Extended distributed shared fabrication services to enable process experimentation; continued development of fabrication, packaging and metrology tools to address devices and systems developments; expanded available set of shared fabrication processes and associated CAD tools and design libraries. (\$7.1M)

(U) FY 1997 Program:

- Achieve additional factor of 5-10x increase in electronics-to-mechanics integration ratios; explore space of related device designs and architectures enabled by order-of-magnitude increase in integration ratios including electromechanical signal processing elements and radio-frequency components; continue development of fault-tolerant and parallel designs including low-noise, low-drift multi-axis accelerometers and gyroscopes; demonstration of extreme temperature and pressure sensor function in operational environments. (\$9.7M)
- Achieve 400-500 mechanical components/sq. cm systems densities with integrated or hybrid fabrication/assembly techniques; demonstrate MEMS applications using massively parallel MEMS components; initiate new dual-use areas including analytical instruments, precision assembly, on-demand structural strength enhancement and air-vehicle aerodynamic control; begin creation of shared testbed for development and validation of new organizational and control strategies for large-scale, distributed MEMS. (\$25.2M)
- Initiate MEMS Plasma Processing development. (\$4.9M)
- Initiate Piezoelectric MEMS development. (\$2.0M)

- Begin transition of mature fabrication services to self-sufficiency; demonstrate scalable distributed fabrication services for MEMS process experimentation; continue development of MEMS-specific unit processes and associated processing equipment; continue the extension of simulators to address the modeling and coupling of multiple physical forces encountered in MEMS applications; continue dissemination and validation of CAD tools and design libraries. (\$6.9M)
 - Initiate plans to develop on-chip integrated microfluidic systems for improved detection and control of molecular reactions with emphasis on the development of new materials and control of reactions. (\$13.5M)
- (U) FY 1998 Program:
- Devices and Processes - Accelerate and expand on MEMS systems developments that exploit physics and MEMS systems architecture to project micro-scale actions into macro-scale effects such as micro-optomechanical scanners, switches, displays, adaptive optics and aligners. (\$12.5M)
 - System Design and Development - Extend present fabrication processes to cost-effective, large area fabrication approaches. (\$32.3M)
 - Support and Access Technologies - Integrate developments in MEMS, robotics and ultra-electronics to design, construct and field multiple, high-performance, mobile, autonomous systems. (\$9.3M)
 - Microfluidics - Initiate system-level integration through an evolving testbed strategy in which the development of new microfluidic components and processes occurs concurrently with the integration of early prototypes with available chip-based molecular analysis components. Leverage analysis and detection technology from industry, Services, and other DoD programs when compatible with microsystems integration. (\$18.0M)
- (U) FY 1999 Program:
- Devices and Processes - Demonstrate radio-frequency electromechanical filtering, processing, and beam steering and atomic-resolution data storage using precision, parallel read/write structures. (\$10.0M)
 - System Design and Development - Initiate concept demonstrations for systems in the form of model aircraft and weight-supporting structures, and additional concepts in areas including identify friend-or-foe systems, on-chip chemical processing, and mobility. (\$34.5M)
 - Support and Access Technologies - Address the key barriers in MEMS fabrication, packaging and integration to realizing systems demonstrations that will be critical to DoD validation and insertion of MEMS technology. (\$11.0M)
 - Microfluidics - Continue system-level integration on new microfluidic components and processes. (\$16.0M)

(U) **Mission Description:** The goal of the MARITECH Program is to preserve the U.S. shipbuilding industrial base by improving the industry's commercial competitiveness through advanced technology applications. For the Defense Department, a competitive shipbuilding industry optimizes Navy ship acquisition reform and allows realization of the Department's objective for affordable Navy ships. The goal of the DoD Acquisition Reform Program is to take advantage of the best commercial practices of industry and thereby achieve cost reductions of the ships and systems it purchases. Having operated exclusively in a protected domestic market, the U.S. shipbuilding industry has not implemented the best commercial processes necessary to compete in the international arena or to build affordable Navy ships. The government's attempt at acquisition reform, as it applies to ship acquisition, could fall short if U.S. shipyards are not commercially competitive. The key for acquisition reform is for the U.S. shipbuilding industry to attain global commercial competitiveness.

(U) This is a two-phased program that provides products and infrastructure for the near and long term. The near term effort enhances international competitiveness through the development of a portfolio of U.S. ship designs for the international marketplace and the build strategies for their competitive price and delivery. This effort is being enhanced by developing an infrastructure that includes the implementation of electronic communications and commerce throughout the industry, and by participating in an industry-wide forum for problem solving on a technical level.

(U) The long term effort includes the infusion of innovative product technologies and process improvements that brings the capabilities of the U.S. shipbuilding industry above those of foreign shipyards. This will result in a larger share of the international market, and a self-sustaining, highly efficient U.S. shipbuilding industry.

(U) **Program Accomplishments and plans:**(U) **FY 1996 Accomplishments:**

- Completed shipbuilding strategy development initiatives and new ship designs begun in FY 1994. (\$13.5M)
- Completed advanced technology development initiatives started in FY 1995. (\$8.2M)
- Established a National Shipbuilding Consortium. (\$.6M)

Electric Vehicles
PE 0603747E, R-1 #50

COST (In Millions)	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	Cost to Complete	Total Cost
Electric Vehicles EV-01	14,694	14,707	0	0	0	0	0	0	0	N/A

(U) **Mission Description:** Electric and hybrid electric drivetrains provide compelling advantages for future tactical and combat vehicles. Of particular importance is a 50-percent reduction in fuel consumption due to higher efficiency, improved acceleration and maneuverability due to immediate torque to the wheels or tracks, and dramatically reduced thermal and acoustic signatures when operating from on-board energy storage. Affordability is addressed through reduced logistics requirements and the dual use applications of these technologies.

(U) The DARPA Electric and Hybrid Vehicle Technology program is pursuing research, development, and demonstrations of technologies for electric and hybrid vehicles that address military missions, modernization, and cost mitigation. Established by Congress in FY 1993, the program has pursued technology development and prototype demonstrations that are essential for future military systems, enhancing national energy security, and facilitating compliance by the Armed Services with federal clean air legislation. DARPA uses a unique decentralized management approach working directly with seven regional consortia. These diverse consortia provide a minimum of 50% of the funding and cooperatively function to overcome the challenges of developing electric and hybrid vehicle technologies. Consortium participants include military laboratories and bases, state and local governments, large and small defense contractors, well-established and startup manufacturers of vehicles and components, electric and gas utilities, public interest groups, and universities. Military requirements and infrastructure are implemented within this program at minimal federal investment, leveraging significant funds.

(U) Technology development is focused on: High-specific power engine/generator sets, including multi-fuel capable, high efficiency, and low emissions turbines, diesels, and rotary engines; Power control devices, including high-performance power semiconductors, control algorithms, and circuit integration and packaging; Energy storage devices, including advanced batteries, rapid battery recharging, flywheels, and capacitors; Electromechanical conversion, including alternating current and direct current, and linear motors; and Lightweight high-strength materials, including space-frames and composites. These dual-use electric drivetrain technologies are being demonstrated in both commercial and military chassis. The technologies are directly relevant and are coordinated with the DARPA Combat Hybrid Power Systems program (budgeted under LNW-01) which is developing an integrated electric power system to provide both continuous and pulsed power to all of the subsystems on a combat vehicle including weapons, C3I, countermeasures as well as the electric drivetrain developed in this program.

(U) **Mission Description:** This program element is budgeted in the Advanced Technology Development Budget Activity because its purpose is to demonstrate and evaluate advanced information systems research and development concepts. The FY 1996 funding for these programs was previously budgeted in the Experimental Evaluation of Major Innovative Technologies, PE 063226E.

(U) The Command and Control Information Systems project is developing the technologies necessary to facilitate joint campaign planning and control throughout the battlespace. The primary program in this project is the Joint Forces Air Component Command System (JFACC), that will improve air combat coordination and targeting from initial planning through Air Task orders. Other programs addressed in this project includes: the Integrated Battlespace program, the Advanced Joint Planning (AJP) advanced concept technology demonstration, the Advanced Cooperative Collection Management (ACCM) program and the Speakeasy program.

(U) The Information Integration Systems project will develop the technologies necessary to ensure that the enhanced information required by battlefield combatants is available on a near real time basis. Programs addressed in this project include the Dynamic Multi-User Information Fusion (DMIF) program, the Dynamic Database (DDB) program, the Battlefield Awareness and Data Dissemination (BADD) ACTD, the Airborne Communications Node (ACN) program, and the Command Post of the Future program.

* The FY 1996 program was previously budgeted in Program Element 0603226E (Projects EE-21 and EE-40).

(U) **Mission Description:** Recent military operations, e.g., Desert Storm and Haiti, demonstrated that current theater command, control, communications, intelligence/information systems, planning and rehearsal systems, and non-lethal weapon's capabilities lack the ability to support effective operations in diverse new arenas and scenarios ranging from desert heavy battle to urban areas with large civilian populations. Current capabilities do not provide real-time situational awareness, decentralized battle planning, rehearsal and execution capability, flexible interfaces or critical interoperable wide-area communications. The goals of the programs in this project, described individually below, are to enhance information processing, dissemination and presentation capabilities for the Commander by inclusion of information pertaining to enemy and friendly forces, providing a joint situational awareness picture and improving planning, decision-making and execution support capability and providing multi-media information interfaces and software to "on-the-move users". Integration of collection management, planning and battlefield awareness programs is an essential element of our strategy for achieving battlefield dominance through information systems.

(U) The Joint Forces Air Component Commander (JFACC) Program seeks to revolutionize command and control (C2) of joint and coalition air forces through the incremental development, integration, evaluation, demonstration and transition to the Warfighter of technology and systems which will enable new operational concepts for planning and execution that will significantly improve the responsiveness, efficiency and effectiveness of air operations. Key aspects of the program are: Continuous near-real-time planning and execution with all tasks tied to a central strategy; collaboration among distributed elements to achieve a high degree of integration through the echelons and across operations, intelligence and logistics; and end-to-end management of C2 operations including advanced capabilities for strategy development, target systems analysis, campaign assessment and resource planning. Key technologies include: Centrally managed, multi-stage, concurrent plan generation; planning agents; intelligent resource scheduling techniques; dynamic resource reallocation algorithms; adaptive cueing tools; automated information routers; information tailoring and visualization tools and advanced collaborative and workflow management tools. These technologies will be applied to requirements that include: Continuous mission planning processes which

BA 3 Advanced Technology Development		PE 0603760E, Project CCC-01	

quickly anticipate and react to changes in threat situation, resource availability and synchronization needs; full integration of intelligence and operational activities to support strike operations and prioritized target nomination; empowerment of cross functional product teams to quickly respond to changes; and proper battlefield knowledge to support activities and decisions at multiple echelons. JFACC technologies will be extended to maritime and land component C2 systems supporting joint force operations and associated planning tools will be made interoperable with related DARPA and Service programs (e.g. Advanced Logistics Program -- ALP, Advanced Cooperative Collection Management -- ACCM, and Battlefield Awareness and Data Dissemination -- BADD). Program execution features a multi-phased, develop-demonstrate-transition approach, including close coordination with the Air Force and the Theater Battle Management Core Systems (TBMCS) development program which will serve as a near term precursor to the more revolutionary JFACC program.

(U) The Integrated Battlespace (IB) Program will extend emerging information technologies and develop new methods to integrate joint force planning tools and operations management software applications. IB focuses on extending capabilities across service components (e.g., air, land, maritime) as well as between functional components (e.g., intelligence, operations, logistics, command-and-control warfare). IB will leverage technology from the JFACC program, Advanced Logistics, Planning and Decision Aids, and Genoa to coordinate and synchronize joint operations. IB will develop technology to support force allocation decision-making based on the CINC and Joint Task Force Commander's intent.

(U) With the growing dependence on information systems and the pressing need to be able to get the right information to the right person at the right time, it becomes critical to deliver and protect information and assure the availability of associated services -- particularly in a stressed environment. Information assurance technologies will be integrated into future versions of the Defense Information Infrastructure (DII) Leading Edge Services (LES) to provide a robust architecture across a wide range of DoD information systems. The development and fielding of secure information systems will be a continuing process of development and upgrading of existing systems and capabilities. The initial investment provides: near term applications to provide a modest level of protection; a testbed to test and evaluate available commercial and government applications and procedures; and a mechanism to test advanced secure information development in an end to end environment.

(U) Emerging technologies in Command and Control promise significant enhancements in operational readiness, planning and crisis response. The Advanced Joint Planning (AJP) ACTD seeks to evolve selected advanced planning tools, in a distributed collaborative environment at US Atlantic Command (USACOM), to evaluate the potential for enhancing Battle Staff Command and Control capabilities. Based on the evaluation results of this selected subset of

PE 0603760E, Project CCC-01

planning tools, a full set of tools will be integrated into the USACOM Battle Staff Planning System. This "leave behind" system will form the model for upgrades to other CINC Planning Systems.

(U) A new generation of collection systems will provide dramatically increased volumes of higher fidelity data to the operational decision maker. The challenge will be to dynamically manage and synchronize this advanced collection architecture with the processing, exploitation, and dissemination capabilities to provide the critical information to the decision maker in the constantly changing operational situation. The conventional requirements management, tasking, collection, processing, and exploitation process is unable to support the dynamics of a constantly changing operational environment. The Advanced Cooperative Collection Management (ACCM) Program will expand on efforts begun under the JFACC program and develop Continuous Asset Planning, Automatic Tasking, and Multi-asset Synchronization capabilities which will provide the collection management tools required to dynamically optimize/synchronize, schedule, and task the spaceborne, airborne and ground based collection, processing, exploitation and dissemination architecture. Collection Management (CM)-Link will optimize the architecture's capability to effectively support multiple operational users simultaneously by providing all echelons with: A common view of the collection environment; current status of collection, processing, exploitation, and dissemination operations; faster than real-time simulations in support of trade-off decisions; and the ability to conduct real-time multi-echelon coordination and shared decision making. ACCM is coordinating closely with the DIA Integrated Collection Management ACTD and the Joint Collection Management Tools acquisition program which will be recipients of DARPA technology as it matures.

(U) The Speakeasy Program will demonstrate a software-programmable communication system in a tactical environment. Speakeasy, which operates over the 2 Mhz to 2 Ghz band, provides the capability to implement wireless communications concepts to meet Service requirements. Speakeasy is an open architecture-based, software-programmable communications terminal supporting simultaneous operation on a minimum of six radio frequency waveforms (four programmable channels in addition to ones for the global positioning system and cellular). The program is transitioning to the Services in FY 1998 after an operational demonstration of the system during the Task Force XXI exercise in FY 1997.

(U) Program Accomplishments and Plans:(U) FY 1996 Accomplishments: N/A(U) FY 1997 Accomplishments:

- Conducted phase one "proof-of-concept" warfighter demonstration of prototype components at the USAF Battle Management Battle Lab, Hurlburt AFB, FL in Jan 97. Prototype components included: Air operations resource.

* The FY 1996 program was previously budgeted in Program Element 0603226E (Projects EE-21 and EE-40).

(U) **Mission Description:** The goals of this project are to take diverse inputs, including those planned as outputs from the PE 06063762E Sensors and Exploitation Systems Project (SGT-04), and perform distributed and dynamic all-source correlation and fusion to produce an integrated, geo-spatially referenced, battlefield database and knowledge-base, and through the use of wideband dissemination and integrated sensor management allow multi-site, real-time, collaborative situation assessment and course-of-action evaluations. These goals are being addressed by the Dynamic Multi-User Information Fusion (DMIF) project, the Dynamic Database (DDB) program, the Battlefield Awareness and Data Dissemination (BADD) ACTD, the Airborne Communications Node (ACN) project, and the Command Post of the Future program.

(U) The Dynamic Multi-User Information Fusion (DMIF) program is the premiere fusion advanced technology development program for the defense and intelligence communities, including next-generation automated capabilities to support the operational service fusion systems: ASAS, TBMCS/CIS, and JMCIS. The program is developing and inserting a product line of fusion capabilities that combine information from multiple sensor-based sources (eg, TIBS broadcasts, SAIP outputs, HUMINT reports, and Binocular SIGINT information) as well as outputs from multiple fusion engines (such as those resident within TBMCS, ASAS, the Common Ground Station (CGS), or Regional SIGINT Operations Centers (RSOCs)). Any given insertion of DMIF would combine, focus, and rectify information from these disparate sources to provide the joint warfighter with a clear and actionable picture of the battlespace. This DMIF-created picture will drive information across the ops-intel divide. In current GCCS transition plans, DMIF will populate the database (Situation Object Repository) that provides a real-time mission focused picture of the battlespace (via the Situation Server) to all requesting applications. More generally, DMIF is building a series of low-cost applications (Product Finishers) to provide "finished" information products to a wide variety of ops systems, including applications for targeting, SEAD, maneuver control, and logistics planning. In all these efforts, a key DMIF program objective and measure of success is focused, rapid and effective transition of advanced fusion technology to warfighters via technology transition efforts already underway with key service C4I programs.

Command, Control and Communications Systems,
PE 0603760E, Project CCC-02

(U) The Dynamic Database (DDB) program will expand on work begun under DMIF and SAIP (SGT-04) to develop the technology to maintain a Dynamic Situation Model by indexing all relevant information about the battlespace according to geospatial and other attributes, at the entity (e.g., vehicles and combat units), terrain, and signal feature level. The database will be able to store selected imagery and annotations, three dimensional site models, battlefield entities and relations, terrain parameter maps, and physical and signal features from imagery and terrain generation applications, all aligned and indexed for rapid, common access. Methods for updating and accessing the Dynamic Situation Model will be provided. The program will also develop the database services needed by users and applications, including DMIF and BADD, such as near real time generation of current terrain features, entities, and properties such as lines of communications, change detection, line-of-sight and terrain suitability calculations, and trafficability analysis.

(U) The objective of the Battlefield Awareness and Data Dissemination (BADD) Advanced Concept Technology Demonstration (ACTD) is to deliver, install and evaluate an operational prototype system that delivers to warfighters a consistent operational picture of the joint/coalition battlefield, allows commanders to design/tailor their own information system, and provides access to key transmission mechanisms and worldwide data repositories. The description of the battlespace provided to the warfighters under this ACTD will be tailored to their mission needs by intelligent selection of information to be broadcast, intelligent processing of user requests (pull) and filtering at the warfighter workstation so that needed information is available. BADD will be evaluated through participation in exercises and demonstrations, and by insertion into ongoing pilot services, such as the Joint Broadcast Service installed in the European Theater in April 1996. BADD is also operating under a Memorandum of Agreement with the Global Broadcast Service Program Office to provide advanced information management capabilities and new applications for this system as part of the overall plan of transition of BADD developments to operations after test and evaluation in the ACTD. Selected applications and dissemination services will be transitioned to the Defense Information Systems Agency (DISA) for incorporation into the Defense Information Infrastructure Common Operating Environment (DII/COE).

(U) The Airborne Communications Node (ACN) program will provide range extension and rapid deployment for many new and existing military communications systems. This is achieved through the placement of a highly flexible radio communication system on the Global Hawk High Altitude Endurance unmanned airborne platform. The ACN will connect isolated and rapidly maneuvering forces with high data rate communications, provide reach-back connectivity to CONUS from forward elements, and allow gateway connectivity among dissimilar radios. The program will conclude with field demonstrations in FY 2000.

Command, Control and Communications Systems,
PE 0603760E, Project CCC-02

(U) The objective of the Command Post of the Future program is to develop and evaluate a tailorable, deployable integrated command and control information environment that adds significant value to the operational Commander in the field. The system design will be based upon an understanding of how to display information to enhance the assimilation and understanding of a wide range of warfare scenarios. Currently employed Command Posts operational support systems do not have the capacity nor technology to provide an effective decision support environment for the rapidly changing, multi-dimension battlespaces of today's and tomorrow's missions. The Command Post of the Future will address these shortcomings by exploiting leading edge technologies found in industry, at research facilities and those technologies that DARPA is currently developing (JTF ATD, JFACC, BADD and Dynamic Database/DMIF, ALP and the technology programs HPKB, I*3, CVIM, HCI, PDA). This will enable the commander of the future to enter a CP that in today's terms is a world of virtual reality. This CP will go beyond flat displays of text, 2D graphics and video to rapidly shift this paradigm and to move to a 3D representation where the commander will "move" about the battlespace in a virtual 3D world generated with intelligent presentation where the commander will "move" about the battlespace and subordinates via real-time interactive conferencing, and have a natural language interface and high-precision information retrieval.

(U) Program Accomplishments and Plans:(U) FY 1996 Accomplishments: N/A(U) FY 1997 Program:

- Dynamic Multi-User Information Fusion (DMIF) program: Develop and demonstrate, with Service transition partners, adaptive fusion processes and services for providing tailored situation representations which facilitate technology insertions and functionality through a broad spectrum of operating environments. Initiate the construction of a simulated test environment for early assessment of user requirements and operational concepts, for performance evaluations and validation of fusion engines, and for easy integration with other developmental and Service information systems. Continue the insertion begun in FY 1996 of DMIF capabilities into the Combined Air Operation Center (CAOC) in Vicenza, Italy. Perform pilot experiments, system performance definition, and entity-level development for a Dynamic Database. Demonstrate a prototype stand alone, multi-source, inference-based fusion system for a limited target set at a major joint operations center, and migrate that system toward an open, agile, and robust architecture to promote interoperability with existing ops/intel battlefield information systems. (\$18.1M)
- Battlefield Awareness and Data Dissemination (BADD) ACTD: Participate and be evaluated in Task Force XXI Army Warfighting Experiment. Demonstrate system capabilities in a series of demonstrations, including a joint demonstration (called the Joint Forces Integration Demonstration) involving Navy, Marine and Air Force

<p>elements. Capabilities and services to be evaluated include: Information Dissemination Manager node located in Washington, DC; Warfighter's Associate terminals in use by the Army at Fort Irvin, at 29 Palms by the Marines, and at Camp Pendleton/NRAID by the Navy and Marines; leased GBS commercial satellite communications interfaces; creation and dissemination of an operational picture of red and blue force status; and dissemination of integrated imagery, video, signals intelligence, terrain, weather, Global Command and Control System (GCCS) and Maneuver Control System (MCS) data. Participate and demonstrate enhanced functionality in various demonstrations (Systems Integration Laboratory, JWID 97, and demonstrations in Korea/PACOM) conducted by the Phase II system integration contractor. Enhancing legacy systems focusing on improving the bandwidth utilization and expanding the user base to include additional major military commands is another objective. Efforts during this fiscal year culminate in the delivery of an operational capability supporting CONUS based users and enhancements to the current capability supporting OCONUS users. (\$31.7M)</p> <ul style="list-style-type: none"> Airborne Communications Node (ACN): Conduct technology development of advanced devices and antennas to facilitate the access of multiple hand held communications devices, start integration of several key enabling technologies (e.g. software radios, common hardware modules and high-speed fiber optic communications infrastructure), develop innovative EMC/EMI mitigation techniques to enable simultaneous operation across the frequency spectrum, VHF to Ku bands. Initiate synthesis of advanced technologies and commence design of the ACN payload. (\$8.7M) <p>(U) FY 1998 Program:</p> <ul style="list-style-type: none"> DMIF: Continue development of the DMIF system to implement an adaptive fusion management architecture which performs real-time context-sensitive fusion engine tasking. This tasking would adapt to the characteristics of available or incoming information, the performance of the available information processing applications (such as ASAS, Quarterback, CIS AA, or RADIANT JADE), and the specific tactical situation (as represented by the commander's critical intelligence requirements or via automated planning systems). Demonstrate improved performance relative to the stand-alone performance of the migration fusion systems being tasked, and improved interoperability compared to the stove-piped operation of the migration systems. Complete first a series of Product Finishers, including those supporting precision targeting and maneuver control, and integrate with ops applications that require real-time focused situation awareness, including JFACC After Next and ASAS Warrior/MCS(P). Transfer entity-level dynamic database capabilities for the FY 1998 initiation of the Dynamic Database program and continue close coordination of these efforts. Demonstrate functionality at multi-service exercises and transition components to DARPA ACTDs (BADD) and to Service and Agency transition partners (Army ASAS, Air Force TBMCS, DISA GCCS). (\$13.0M) Dynamic Database Program: Expand entity-focused database efforts begun under DMIF by building an integrated

Command, Control and Communications Systems,
PE 0603760E, Project CCC-02

prototype for consolidated terrain, signal feature, and entity level representation of a Dynamic Situation Model. Build on algorithms and capabilities previously developed under BADD, Semi-Automated IMINT Processing ACTD (funded under EE-50), Intelligent Integration of Information (funded under ST-11) and especially DMIF, including fusion services, integration of multiple information repositories, change detection and site monitoring, and database mediation, to create a united set of reusable software services that can be mediated for general purpose access by many applications, including DMIF, BADD, and SAIP. Provide an initial test article for integration into the Information Systems Office testbed, and provide a baseline for scalable performance estimates. (\$19.2M)

- BADD ACTD: Participate and be formally evaluated in an ACOM-conducted joint exercise (Unified Endeavor) increasing the level of automation previously provided to users and extending information management and dissemination support at the level of individual battalions/ships. Provide new information management capabilities to include creation of a 3D graphical depiction of a consistent operational picture by near-real-time integration of all relevant databases, identification and semi-automated resolution of differences building on DMIF technology. Operate a CONUS Pilot Service for ACOM components. Demonstrate and deliver an OCONUS Pilot Service tailored for the Pacific theater. (\$47.0M)
- Airborne Communications Node (ACN): Select final design team. Complete payload and unique subsystem design. Select and acquire equipment and modules. Fabricate and assemble payload system and subsystems. Initiate build of System Integration Laboratory (SIL). Commence subsystem Integration and Test. (\$14.2M)
- Command Post of the Future: During this fiscal year the program will focus on the design and initial development of an experimental prototype to be used as a proof of concept. This system will integrate multiple data sources, with a virtual reality collaborative work environment where the battlespace entities have been defined as objects within an "object oriented" 3D graphical based system. Each "object" will have the capability to be expanded by the operational commander or his staff to gain supporting data or new perspectives on the current and projected situation. (\$3.0M)

(U) FY 1999 Program:

- Continue the development of DMIF functionality to include agile models and distributed, collaborative situation assessment, including: expanded GOB, maneuver control, plan monitoring, SEAD, IPB, and course of action analysis. Extend DMIF architecture to create a product line of fusion systems that work flexibly and seamlessly with existing battlefield information systems within the full GCCS-LES environment. Incorporate DMI products into emerging systems such as BADD. (\$8.0M)
- Extend the functionality of the Dynamic Database prototype system to incorporate mature access language, index structure, and search engine capabilities. Incorporate additional common data services, including visibility and change detection computations and flexible trigger, pedigree, and information product

<p>definitions. Prepare for transition to migration systems, by defining a comprehensive regression and performance test set, developing capabilities for uploading and accessing legacy data, and operating as an overlay on existing systems. (\$30.0M)</p> <ul style="list-style-type: none"> BADD ACTD: Continue frequent participation in operational exercises to validate the additional operational capabilities. Examples of increased information management functionality include the creation and dissemination of the consistent operational picture by near-real-time integration of all relevant databases, and identification and automated resolution of differences using DMIF and DDB technology. Provide capabilities to perform resource management of multiple communications paths. Evaluate this capability via participation in a joint demonstration using the Airborne Communications Node (ACN). Operate OCONUS Pilot Service and complete transition of initial CONUS Pilot Services. Enhance the capability to ingest theater sensor data streams, add value by exploitation, and disseminate the raw and enhanced data stream via GBS thereby avoiding the need for many ground sites within line of sight of sensor platforms. (\$46.5M) Airborne Communications Node (ACN): Complete demonstrations in SIL. Initiate ACN integration into Global Hawk HAE UAV. (\$21.0M)

Oct 96 Demonstrate BADD capability (joint exercise) - Joint Forces Integration Demonstration.

Mar 97 Support Task Force XXI Advanced Warfighting Experiment with BADD technology.

Apr 97 Demonstrate Dynamic Multi-User Information Fusion (DMIF) capability at a major joint operations center. (Previous milestone for FY97 MAJCOM delivery re-baselined, due to FY97 budget reductions. Now part of Sep 98 milestone).

May 97 BADD Phase II System Integration Laboratory (SIL) demonstration.

Jun 97 Demonstrate BADD capability (JWID 97).

Jul 97 Deliver DMIF-I to a MAJCOM.

Sep 97 Complete DMIF testbed for system design, concept of operations and human computer interface development.

Nov 97 Demonstrate DMIF enhanced capability at Division XXI (high value target tracking/projection, hierarchical force assessment).

Nov 97 BADD supports the Army's Division XXI exercises.

Dec 97 Deliver BADD CONUS Pilot Service.

Apr 98 Demonstrate BADD capability (Unified Endeavor 98-2).

Nov 97 Complete ACN Design Tasks.

May 98 Demonstrate DDB prototype in conjunction with ISO testbed.

Jun 98 Complete integration and lab demo of DMIF II and demonstrate interoperability with BADD.

Mar 98 ACN payload Final Design Review.

Jul 98 Support operational exercise OCONUS (PACOM/Korea) and CONUS upgrade for BADD.

Sep 98 Demonstrate DMIF capability to enhance performance of existing intelligence applications (such as ASAS, GCCS, TBMCs) in joint-level simulation of focused situation assessment and operations support.

Sep 98 Complete prototype design of the Command Post of the Future.

Sep 98 Complete ACN Subsystem Development.

Sep 98 Deliver BADD pilot service to OCONUS with DMIF baseline capability.

Dec 98 Bench Test ACN Payload.

Mar 99 Use Dynamic Situation Model from DDB for change detection, situation awareness, and dissemination in laboratory demonstration with SAIP, DMIF and BADD.

Jun 99 DMIF demonstration of distributed comprehensive battlespace awareness in joint-level simulation with service and Agency migration systems (ASAS, GCCS, TBMCs).

Jun 99 ACN SIL Integration and Test Complete.

*The FY 1996 program was previously budgeted in the Experimental Evaluation of Major Innovative Technologies, PE 0603226E (Project EE-37).

(U) **Mission Description:** The strategic environment in which the United States operates will require Joint Forces to operate across the full spectrum of conflict. At the same time, resources will continue to shrink, requiring the Department to search for the most cost effective means to perform the full spectrum of defense functions. To support the National Military Strategy, the Advanced Distributed Simulation (ADS) program is developing advanced simulation technologies that provide seamless synthetic battlespace that will enable high fidelity simulation across a full range of DoD functions, e.g. Joint/Service readiness training and mission rehearsal; Joint/Service doctrine development and refinement; requirements analysis; design and prototyping; and operational/tactical planning. As technologies mature, they are integrated, tested and demonstrated in exercises/demonstrations of varying size and complexity. Within the ADS Programs the Synthetic Theater of War (STOW) Advanced Concept Technology Demonstration (ACTD) program is developing advanced simulation technologies that provide a seamless synthetic battlespace to support joint training and mission rehearsal activities. STOW applied high fidelity, entity based simulation technologies across the full spectrum of conflict enabling evolutionary changes in how joint forces train and rehearse for operational missions. The ultimate goal is to develop mature simulation technologies capable of representing Joint Forces from the level of Operations Other Than War (OOTW) up to the Major Regional Contingency level of combat. Specific technology efforts being undertaken as part of STOW include 1) Large scale simulation system interfaces to real world C4I systems; 2) Advanced Distributed Networking; 3) Instantiation of DoD's High Level Architecture (HLA) within the actual simulation; 4) Advanced simulation forces and environmental models and; 5) Interoperability with the United Kingdom Synthetic Environment Program. These technologies are then transitioned to service and joint simulation developers, e.g. JSIMS.

(U) The STOW ACTD is comprised of Synthetic Environment, Synthetic Forces, Systems Design and Integration and, Advanced Network components. The Synthetic Environment component concentrates on the creation of large scale digital environments including representation of dynamic terrain and targets, weather and environmental phenomena, as well as seasonal and diurnal variations. The Synthetic Forces component creates a scaleable, computer-generated joint military force that is both representative and behaviorally credible. This entity based simulation includes models of command nodes as well as various intelligence sensors and their related platforms. The high fidelity of the computer generated forces provides the capability to resolve battle outcomes at the weapon system level of detail.

<p>The system Design and Integration component develops the overall DoD High Level Architecture (HLA) compliant system design, interfaces to C4I systems, distributed exercise management, data collection and, after action reviewed technologies. This architecture supports the capability to initialize, manage, and analyze large scale distributed joint and combined exercises. The Advanced Networks component develops and tests Networking technologies necessary to support large scale distributed exercises. DARPA will transition products, documentation and lessons learned to the Defense Information System Agency (DISA) to facilitate the efficient and cost effective utilization of evolving network infrastructures.</p> <p>(U) The STOW prototype will support the United States Atlantic Command (USACOM) JTF level exercise, Unified Endeavor in October 1997, as well as, subsequent USACOM exercises during FY 1998 and FY 1999. Operational experience in these large scale joint exercises provides valuable lessons learned, documentation and technology products to support the emerging family of Joint Simulation systems, e.g. JSIMS, WARSIM, NASM, JSIMS Maritime component.</p> <p>(U) The Operational Simulation Technology Program has been divided into two programs. The Advanced Simulation Technology Thrust (ASTT) builds on the STOW Program and develops advanced simulation technology supporting the next generation of DoD simulation systems. The goal of the ASTT program is to extend core simulation technology research such as advanced synthetic environments modeling, multi-resolution modeling, and scaling. The ASTT program will act as a bridge to future DoD simulation developments such as the Joint Simulation System (JSIMS). The other element of the OPSIM program will integrate Advanced Distributed simulation and ASTT developed technologies into operational planning systems to provide course of action analysis.</p> <p>(U) <u>Program Accomplishments and Plans:</u></p> <p>(U) <u>FY 1996 Accomplishments:</u> N/A</p> <p>(U) <u>FY 1997 Accomplishments:</u></p> <ul style="list-style-type: none"> • Developed an interactive synthetic terrain database which supports an environmentally robust joint battlespace. This includes the continued development of environmental technologies such as interactive terrain and hydrology, battlefield obscurant and diurnal effects. Developed technology for simulating the full range of dynamic terrain effects, e.g. cratering, damaged buildings, fighting positions, etc. (\$6.0M) • Developed and transitioned a broad range of synthetic forces representing combat elements integrated with the DoD HLA a distributed command and control structure from all of the services. Integrated a distributed command and control structure portraying, in simulation, the influence of one command level on the actions

of subordinate synthetic units. Continued to re-architect synthetic forces to a HLA compliant design. (\$15.0M)

- Demonstrated the prototype Synthetic Theater of War simulation supporting a seamless land/sea/air warfighting synthetic environment capable of representing a Joint Task Force (US-UK). Integrated and tested expanded HLA compliant network technologies and network security devices. Integrated initial versions of the DMSO-DARPA Run-Time Infrastructure. Developed and integrated simulation interfaces to real world C4I systems. Developed and integrated a HLA compliant data collection and analysis component to support After Action Reviews. Designed and tested an advanced ATM based wide area networks to support large scale joint exercises. Began the transition of STOW technologies, documentation and lessons learned to emerging joint and service managed simulation programs, e.g. JSIMS, WARSIM and other service simulations. (\$15.0M)
- Developed advanced simulation technologies, beyond the scope of the STOW ACTD, supporting next generation simulation systems (e.g. JSIMS, WARSIMS, et.al.). Technology efforts include: Multi-fidelity synthetic environments and multi-resolution modeling of synthetic forces, adaptive behaviors and rapid behavior development for synthetic forces, scaleability to 20K platform objects in real time, improved synthetic environments network performance, and data collection techniques for use in a multi-cast environment. (\$4.6M)
- Developed and demonstrated a prototype integrated simulation capability, to support rapid course-of-action analysis for a single service planning system, using automated, faster than real time (FTRT) battle simulation, with both friendly forces and reactive OPFOR to enable rapid review of courses of action developed as part of mission planning. (\$1.9M)

(U) FY 1998 Program:

- Based on lessons learned from Unified Endeavor 98-1 and USACOM operational requirements, continue to improve upon the STOW prototype to provide demonstrations of an increased operational capability to the joint warfighter. This includes enhancing the warfighter's capabilities to employ high fidelity, platform level simulations for increased readiness. Integrate new/improved synthetic environments, synthetic forces, and networking technologies as well as products developed through the United Kingdom's Synthetic Environment program. Integrate ASTT technologies as appropriate while transitioning STOW technologies to JSIMS. (\$13.5M)
- Continue to develop advanced simulation technologies to support JSIMS, WARSIM and other service simulations. Technology efforts include: Adaptive multi-skilled Synthetic Forces; Scaleability greater than 20,000 objects; distributed multi-cast data collection on large amounts on data; rapid generation of computer generated forces and alternative methods of SAF generation; single synthetic environments database

abstraction to accommodate multiple simulation requirements; initial multi-resolution modeling techniques. (\$13.0M)

- Continue to develop course of action analysis capability based on advanced simulation technologies. Expand analysis capability to multiple joint planning systems. (\$2.0M)

(U) FY 1999 Program:

- Continue to develop, demonstrate, and transition prototype technologies supporting a DoD High Level Simulation Architecture. Demonstrations will continue to focus on the representation of a seamless land/sea/air warfighting synthetic environment with an ever increasing degree of realism, supporting service and joint operational training and retaining the arbitration of battle outcomes at the platform level. (\$13.8M)
- Continue to develop advanced simulation technologies to support JSIMS and WARSIM and other service simulations. Technology efforts include demonstration of: Scaleability to 100K objects in the simulation, goal based reasoning for synthetic command entities, advanced multi-resolution modeling techniques, and improved terrain data base correlations. Complete transition of all technologies to JSIMS, et al. (\$12.9M)

Plan Milestones

Oct 97 United Endeavor 98-1, demonstrate STOW's ability to support technically and operationally significant joint and combined operations.

Oct 97 Demonstrate a major application of the DoD High Level Architecture.

Mar 98 Demonstrate the ability of Command Forces to plan a course of action, replan/respond to unexpected OPFOR tactics.

Sep 98 Demonstrate ability for ADS network to support real-time transport of a .3 Gigabyte at 3k transactions per second.

Sep 98 Continue to support USACOM training objectives in future United Endeavor Exercises.

Oct 98 Demonstrate STOW's ability to support significant mission rehearsal and crisis response operations. Integrate and evaluate technologies developed under the United Kingdom's Synthetic Environments program. Utilize the STOW prototype to support the operational evaluation of technologies developed under the ASTT and JSIMS program.

Sep 99 Complete the development, integration and documentation of the STOW prototype transitioning all to JSIMS.

Sep 99 Transition ADS simulation technologies to the JSIMS and the service simulation developments.

COST (In Thousands)	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	Cost to Complete	Total Cost
Global Grid Communications CST-02	(41,957*)	52,190	44,566	43,916	44,750	49,549	54,549	49,549	Continuing	Continuing

* The FY 1996 program was previously budgeted in the Experimental Evaluation of Major Innovative Technologies, PE 0603226E (Project EE-45).

(U) **Mission Description:** This project develops and demonstrates advanced networking technologies needed for global defense operations in the 21st century. Network services will be developed in order to support geographically dispersed staff for crisis management and to support warfighters in rapid deployment, highly mobile scenarios. The program will demonstrate that information technologies can be integrated with both advanced optical, high performance networks and mobile, wireless tactical. This will provide multimedia information flows, efficient use of bandwidth, and minimal logistical requirements for warfighting, disaster relief, emergency medical support. The program requires the design, adaption and development of new internetwork protocols.

(U) The goals of the JTF-ATD include development of a rapid Commander Joint Task Force (CJTF) crisis response capability for a range of situations from multiple regional conflicts (MRCs) to operations other than war (OOTW) capable of being established and operational in days; provide collaborative planning and execution management for the JTF of integrated, executable operations plans in hours; provide enroute planning and execution management for the JTF staff; provide a software reference architecture that provides access to the defense information infrastructure (DII), links the national command authority (NCA), commander in chief (CINC), JTF and the components, and enables rapid tailoring of the operational environment; provide common servers and an application suite; migrate to the DII.

(U) The goal of a Warfighter's Internet is to expand open architecture and internetworking technologies into the mobile wireless domain to: provide a robust, automatically reconfigurable, internetworking capability; and, to support warfighters in rapid deployment and highly mobile scenarios. This will be accomplished through enabling a backbone communications network consisting of multiple airborne nodes which in turn connect to users and networks on the ground, on the ocean, and in the air. Provision for multimedia information flows, efficient use of bandwidth, and minimal logistical requirements are key objectives that require the design, adaptation and development of new network protocols for mobile, wireless battlefield networks. Technology development and demonstration will focus on networking technologies to integrate across existing and developmental communication systems and networks using airborne nodes such as Global Hawk (Airborne Communications Node). A scalable internet will be demonstrated in conjunction with joint service exercises and advanced warfighting experiments.

* The FY 1996 program was previously budgeted in the Experimental Evaluation of Major Innovative Technologies,
PE 0603226E (Project EE-46).

(U) **Mission Description:** The goal of the Defense Simulation Internet (DSI) program is to research, develop and test at scale (worldwide), a network infrastructure capable of enabling distributed, real-time, multi-media (video, voice, shared data and work spaces) simulation that will seamlessly integrate all simulation, modeling, command and control functions from early design to battle rehearsal enroute to the conflict. The DSI meets DoD security requirements by using a commercial-off-the-shelf (COTS) encryption device (INES). The communications needs of the distributed, real-time, multi-media modeling and simulation community cannot be met with any other available technology. Commercial vendors are pursuing some of the required technologies, but development is too slow and unfocused to accommodate the immediacy of the Department of Defense's simulation requirements. The DSI program provides focus for the commercial development of the technologies needed by the simulation community for distributed work environments worldwide. Over 100 nodes currently extend the DSI to each of the Services, most of the Commanders-in-Chief (CINCs), some of our allies and other Government affiliated sites. These locations constitute the network's user sites; they provide valuable feedback on the technologies and methodologies being pursued and critical capability for both ongoing and major modeling and simulation events. A key mission of the DSI is to provide real time infrastructure for the Synthetic Theater of War (STOW) 97.

(U) The DSI will transition to the Defense Information Systems Agency (DISA) Defense Information Systems Network (DISN) by the end of FY 1997 and be operated on a reimbursable basis. It will be jointly managed by DISA and DARPA through the Advanced Information Technology Systems Joint Program Office. The transition of the DSI into the DISN provides affordability through consolidation of the costs required to operate multiple networks while continuing to support modeling and simulation requirements.

(U) **Mission Description:** The Sensors and Guidance Technology program element is budgeted in the Advanced Technology Development Budget Activity because it is developing the system oriented technologies to enhance sensor and weapon system accuracy and capability to meet current and emerging threats. Four projects are funded in this program element: Guidance Technology, Aerospace Surveillance Technology, the Air Defense Initiative, and Sensors and Exploitation Systems.

(U) The Guidance Technology project is leveraging geolocation technologies to enhance the navigation and/or guidance packages of airborne platforms, ground vehicles and weapons. These improved systems will improve the accuracy and effectiveness of stand-off weapons, minimizing collateral damage while reducing the cost-per-kill.

(U) Aerospace Surveillance Technologies programs are developing technologies to improve the accuracy and timeliness of surveillance systems in all weather, in hostile reception environments, and when necessary, in a covert manner. The five programs funded by this project exploit recent advances in multispectral target phenomenology, signal processing, high performance computing and micro-electronics technologies.

(U) The Air Defense Initiative is an on-going activity whose overall goal is to reduce the proliferating cruise missile threat and enhance the survivability of U.S. assets in the face of enemy electronic countermeasures.

(U) The objective of the Sensor and Exploitation Systems project is to provide the warrior with situational awareness and battlefield dominance by developing key sensor technologies; providing near-real-time exploitation of imagery data; and semi-automated target recognition and tracking.

* The FY 1996 program was previously budgeted in the Experimental Evaluation of Major Innovative Technologies
PE--0603226E.

(U) **Mission Description:** Fire-and-forget stand-off weapons need precise targeting information if critical fixed and mobile targets are to be eliminated effectively with minimal collateral damage, and minimum cost-per-kill. This requires that: (1) military surveillance and targeting systems geolocate targets accurately in the same coordinate system (i.e. WGS-84) in which the weapon system navigates; (2) the surveillance, targeting and weapon systems have precision navigation and guidance systems on-board; and (3) navigation and target location systems operate day/night and in adverse weather. In addition, future systems designed to accomplish precision strike missions must be significantly more affordable. The achievement of these characteristics in an integrated system is the goal of this program. The Global Positioning System (GPS) Guidance Package (GGP) technologies are applicable for both new or retrofit guidance/navigation packages for a variety of airborne platforms, ground vehicles, surface-to-surface standoff weapons and air-to-surface weapons. Additional thrusts are included in this project to increase the robustness of precision GPS navigation; to increase the versatility of navigation systems applications by developing micro-electromechanical sensor inertial navigation system technologies; and to apply the geolocation technologies/techniques to precision threat geolocation (Advanced Tactical Targeting Technology Program).

(U) GGP tightly integrates a miniature GPS receiver and an all solid state, low cost, navigation-grade, interferometric fiber optic gyroscope (IFOG) based miniature inertial measurement unit (MIMU) with an advanced navigation computer into a low cost (\$15,000), precision navigation system. GGP Phase I addressed the technology issues involved in: (1) miniaturizing navigation grade inertial measurement units (IMUs) into a compact, manufacturable configuration; and (2) developing a multi-channel-on-chip, high dynamics GPS receiver. A Memorandum of Agreement (MOA) has been signed and implemented to demonstrate a Phase 1 unit on an Army Fire Support Team Vehicle (FIST-V). Successful demonstrations were conducted at Redstone Arsenal in June 1995 using a M981 FIST-V. Successful demonstrations also were conducted on an F/A-18. These tests assessed the performance of tightly coupled systems in high dynamics and validated Phase 1 design scenarios. GGP Phase 2 requirements place more stressing demands on performance of MIMU components and call for further reductions in size, power and weight. An MOA has been signed with the Navy designating GGP Phase 2 as the Navy's Advanced Integrated Navigation and Control Package. Another MOA was signed with the Program Executive Officer, Tactical Missiles, Army Missile Command. Potential applications

include the Multiple Launch Rocket System. A third Memorandum of Agreement (MOA) is in coordination with the Program Executive Office, Ground Combat and Support Systems, Army Tank and Automotive Command. Potential application is the Bradley Fire Support Team Vehicle (FIST-V).

(U) The Global Positioning Experiments (GPX) will increase the robustness of GPS receivers by increasing their ability to operate effectively in presence of enemy jamming or countermeasures. First, an all-in-view Miniature GPS Receiver (MGR) chipset will be upgraded to demonstrate direct precision GPS code acquisition by employing a fast acquisition correlator engine and high performance clock. Operation with precision P(Y) GPS code signals increases the MGRs robustness to jamming. The second thrust will provide for the design, development, implementation and demonstration of a low cost, all digitally controlled GPS adaptive phased array receiver antenna; coherent precision matched analog antenna components; and antenna recalibration for stressing military environments.

(U) The Micro-Electromechanical Sensor Inertial Navigation System (MEMS INS) program will improve the silicon based, inertial sensors (gyros and accelerometers) developed in the MEMS technology program and integrate them with navigation software into a low power, small, light weight, low cost, tactical grade (0.1 degree per hr to 10 degrees per hr drift rate) INS. In addition to more portable applications, the MEMS INS will be generic for insertion/imbedding into other military systems. MEMS INS Phase 1 will perform the following: (1) select and improve appropriate MEMS inertial sensors, (2) select and refine foundries/foundry processes, (3) design the mechanical subsystem, and (4) select/refine the navigation software and perform INS simulations of the modeled sensors. Phase 2 will develop the MEMS inertial sensors brassboard, integrate them into a MEMS INS and demonstrate the brassboard in the field.

(U) The Advanced Tactical Targeting Technology (AT3) will demonstrate a passive tactical targeting system for the lethal suppression of enemy air defenses (SEAD). The SEAD mission must now be accomplished in the face of new electronic order of battle (EOCB) and new engagement tactics by enemy air defenders such as frequent threat emitter shutdowns. Today's targeting systems fail to provide timely information to target the growing mobile threat. Far more comprehensive, near real time, cockpit battlefield awareness must be provided. This includes synchronization of multi-platform information, long range emitter identification and target geolocation within seconds. An order of magnitude improvement in rapid target geolocation accuracy is needed against mobile surface to air missiles. Emerging DARPA technologies can combine to provide an affordable lethal SEAD tactical targeting capability. These include leveraging the GPS Guidance Package and clock technologies for precision time and location. Low cost, light weight RF wideband digital receiver, processor and adaptive antenna functions can be implemented in advanced technology multichip modules. The Advanced Tactical Targeting Technology (AT3) objectives are to develop passive

targeting technologies with precision time standards, wideband low cost multichip module based radio frequency (RF) receivers and threat association algorithms and to demonstrate an affordable tactical targeting system solution. Two airborne architectures will be considered. One will employ AT3 systems on an opportunistically diverse mix of platforms netted together by communications links. The other will employ a single strike aircraft with two or more dedicated miniature air-launched radar decoys, each carrying an AT3 and communication system.

(U) Program Accomplishments and Plans:

(U) FY 1996 Accomplishments: N/A

(U) FY 1997 Program:

- Complete GGP Phase 2 designs and begin fabrication of two competitive GGP units. (\$10.1M)
- Complete evaluation of Phase 1 units on the Navy testbed aircraft. (\$.2M)
- Investigate and evaluate applications of the Miniature GPS Receiver (MGR) portion of the GGP for enemy air defense suppression. (\$1.0M)

(U) FY 1998 Program:

- Continue fabrication and begin integration of GGP Phase 2 hardware and software. (\$10.0M)
- Design circuits and power management techniques for the direct precision GPS code, low power, robust MGR. (\$5.1M)
- Design the GPS adaptive antenna array, signal processing and control functions for the MGR. (\$4.1M)
- Identify micro-electromechanical sensor (MEMS) foundries and develop MEMS inertial navigation architecture(s). (\$5.0M)
- Initiate Advanced Tactical Targeting Technology (AT3) design and development. (\$8.5M)

(U) FY 1999 Program:

- Perform final integration and testing of GGP units; deliver eight units. (\$4.6M)
- Fabricate and demonstrate the robust MGR. (\$5.0M)
- Conduct final design reviews and complete integration of adaptive GPS receiver antenna and signal processing. (\$6.0M)
- Iterate MEMS foundry inertial sensor fabrication and initiate preliminary sensor testing. (\$9.0M)
- Complete AT3 design and conduct critical component demonstrations. (\$6.8M)
- Begin AT3 brassboard fabrication. (\$5.2M)

(U) Schedule Profile:

Plan Milestones

Jun 97 Conduct GGP Phase 2 critical design review.

Jul 97 Begin fabrication of GGP Phase 2 units.

Feb 98 Begin design of the Advanced Tactical Targeting Technology (AT3).

Jan 98 Complete systems requirement reviews for adaptive GPS antenna array.

Jul 98 Conduct Preliminary Design Review for MEMS inertial navigation system.

Aug 98 Complete preliminary design of the AT3.

Sep 98 Begin integration of hardware and software for GGP Phase 2 units.

Oct 98 Complete design and begin fabrication of the direct P(Y) code, low power MGR.

* The FY 1996 program was previously budgeted in the Experimental Evaluation of Major Innovative Technologies
PE 0603226E.

(U) **Mission Description:** This project funds space and airborne sensor efforts whose purpose is to improve the accuracy and timeliness of our surveillance systems for improved battlefield awareness. Timely surveillance of enemy territory under all weather conditions is critical to providing our forces with the tactical information needed to succeed in future wars. This operational surveillance capability must perform during enemy efforts to deny and deceive the sensor systems, and operate, at times, in a covert manner. This project will exploit recent advances in multispectral target phenomenology, signal processing, large constellation satellite architectures, low-power high-performance computing, and low-cost micro-electronics to develop advanced surveillance systems.

(U) The Eclipse program will develop the concept to deny imagery from advanced enemy sensors. The performance of this function is strongly driven by resolution and obscuration. This concept would be to adversely deny the enemy battlefield situational awareness and limit his capability for the detection, classification and identification of ground-based objects.

(U) The Passive Millimeter Wave (PMMW) Imaging System Program will develop and demonstrate a passive, "all weather" imaging capability for the covert detection and classification of military targets. Aperture sizes to be developed will be an order of magnitude larger than current generation PMMW systems to obtain resolutions ranging from 3 meters to less than 1 meter from tactical UAV operational altitudes. This program will pursue system designs that exploit MIMIC technology to manufacture large numbers of mm-wave components affordably, sparse aperture system concepts that greatly reduce hardware complexity, and recent advances in low power high performance computing. Military applications will be selected and demonstrated based upon deficiencies characteristic of current generation imaging systems - both active and passive.

(U) The Passive Radar Tag for Covert Communications will provide a covert capability to remotely extract data from unattended ground sensors and Special Operation Forces (SOF) in real-time by airborne sensors such as the Joint Surveillance Target Attack Radar (JSTARS) or Advanced Synthetic Aperture Radar System (ASARS) surveillance radar systems. Miniature prototypes have been developed for other radars such as the APS-137 and APS-145 used on the E-2C

RDT&E BUDGET ITEM JUSTIFICATION SHEET (R-2 Exhibit)		DATE	February 1997
APPROPRIATION/BUDGET ACTIVITY RDT&E, Defensewide BA 3 Advanced Technology Development		R-1 ITEM NOMENCLATURE Sensor and Guidance Technology, PE 0603762E, Project SGT-02	
<p>and P-3. The tags will use special wake-up circuitry, surface acoustic wave delay lines, and modulation techniques to detect, delay, and modify radar pulses from these radars such that the return pulse received by the radar will include unique identification numbers and data messages from the tag. Covertness will be obtained by the choice of modulation and the amplitude of the returned signal. The interrogating radars will be modified to detect, identify, and display the tag message. Variants of the tag will be produced to be compatible with air delivered internettted ground sensors and with man portable tags used by SOF units. Low cost tags (<\$300) will be developed for cost effective and covert, friendly situation awareness. Other variants will be used to precisely register synthetic aperture radar imagery and to enhance communications of geolocation and other data between widely dispersed operating units.</p> <p>(U) The Adaptive Spectral Reconnaissance Program will develop a new generation of airborne reconnaissance systems based on spectrally adaptive imaging sensors. Spectral technology will enhance the ability to conduct wide area search for high value targets from both manned and unmanned airborne platforms. This program will, with Defense Airborne Reconnaissance Office funding, develop a system using reflected sunlight. The DARPA funded effort will develop a thermal infrared version to provide day/night capability. This system will be demonstrated on an Unmanned Air Vehicle (UAV) platform.</p> <p>(U) The Tactical Radar Program will develop technologies to meet the stressing needs associated with mobile target detection; i.e. one meter or better resolution with a revisit time of under fifteen minutes. This program will pursue innovative spacecraft and radar designs that minimize complexity and cost; e.g., by employing complex radar waveforms that address range ambiguities. Battlefield Visualization (BV) and geo-referenced Precision Guided Munitions (PGM) call for high-density, high-accuracy Digital Terrain Elevation Data (DTED). Affordable methods of obtaining this data from single and multiple satellites will also be explored.</p> <p>(U) The Novel Antennas Program will develop small lightweight sensor systems with low power requirements that will identify and locate emitters in dense environments. The program will leverage a number of technologies including photonics, antennas, adaptive arrays, superconductivity and digital receivers and will directly attack the stressing problems of co-channel interference and multipath. The system will offer the user community significant capability gain over existing and planned systems. The program will involve close and continuing cooperation with prospective user agencies.</p> <p>(U) The Large Millimeter Wave Telescope (LMT) is a Congressionally mandated program to develop the largest (50 meter aperture) fully steerable millimeter wave radio telescope built to date. The design features a sophisticated</p>

laser metrology system to maintain precise alignment of the optics, and real time closed loop adaptive control actuator system to maintain a near-perfect parabolic surface at all pointing angles and under most environmental conditions.

(U) **Program Accomplishments and Plans:**

(U) FY 1996 Accomplishments: N/A

(U) FY 1997 Program:

- Completed the design of the foundation, pedestal, pedestal bearing, radome and tilting structures and the mechanical drive and pointing systems of the Large Millimeter Wave Telescope program. (\$1.5M)

(U) FY 1998 Program:

- Eclipse program - Perform concept and feasibility analyses to deny imagery from advanced optical sensors. (\$1.0M)
- Passive Millimeter Wave (PMW) Imaging program - Initiate and complete concepts of operation studies for employment of system for the detection and classification of military targets. Initiate and finalize configuration definition for the detection system using MIMIC technology and innovative system design concepts to satisfy user-defined military applications. Initiate fabrication of detection system and configuration definition for the very large aperture classification system. (\$6.0M)
- Passive Radio Frequency (RF) Tags for the Covert Communications program - Perform concept analyses for multiple concepts of operation to include remote communications of sensor data from unattended ground sensors, data communications from Special Operations Forces (SOF), geo-registration of Synthetic Aperture Radar (SAR)/Moving Target Indicator (MTI) imagery, and communications of geo-location and other data between dispersed operating units. System design for each operational concept will be conducted, and fabrication of brass board RF tags, modifications to airborne SAR/MIT processors and ground stations will be completed. (\$7.5M)
- Adaptive Spectral Reconnaissance program - Begin development of a Long Wavelength Infra-red (LWIR) hyperspectral cueing sensor for UAV application. The phenomenology will be established to support the use of this system. These sensors will include both the hardware and software necessary for integration as an airborne wide area surveillance system. (\$4.0M)
- Tactical Radar Program - Initiate concept designs. Develop and mature critical technology areas to include orbital configurations that when combined with innovative system concepts, can provide the required coverage

* PE 0603226E, projects EE-CLS and EE-41 previously funded these efforts.

(U) **Mission Description:** This Project encompasses several advanced technologies related to the development of techniques to counter advanced battlefield threats. These programs include the Novel Antenna Program, the Low-Cost Cruise Missile Defense (LCCMD) Program, the Synthetic Aperture Radar Electronic Counter-Countermeasures (SAR ECCM) Program, The Mountain Top Program, the Air-Defense Simulation Program and the Advanced Signal Processing (ASP) Program.

(U) The SAR ECCM Program will develop techniques to make U.S. Synthetic Aperture Radar (SAR) systems less vulnerable to intentional enemy jamming or deception. SAR systems have become one of the most widely used broad area surveillance systems. They are critically important to the development of battlespace awareness and their jamming and/or deception could seriously degrade U.S. warfighting capability. The SAR ECCM program will determine the military impact of various SAR jamming techniques and develop countermeasures against the highest priority threats.

(U) The DARPA Mountain Top Program provides a cost effective ground-based radar system for the advancement and evaluation of concepts and technologies required for future airborne surveillance radars. Through robust data collection and analysis campaigns, the Mountain Top Program identifies and quantifies natural and man-made phenomena that may limit Airborne Early Warning (AEW) system performance. Central to this activity is the Radar Surveillance Technology Experimental Radar (RSTER), located at the Pacific Missile Range Facility (PMRF), Kauai, Hawaii. In FY 1996, the Mountain Top Project segregated the RSTER hardware program segment from the signal processing and analysis effort to form two distinct programs; Mountain Top and Advanced Signal Processing. The RSTER system continues to serve as the focal point for the Mountain Top Program and program activities continue to concentrate on joint testing and integration to effect a successful RSTER system transition to the Services, specifically, the Navy E-2 Program Office, PMA-231, by FY 1998.

(U) The DARPA Air-Defense Simulation (Transition Support) Program conducts integrated analysis, modeling, simulated exercise, and demonstration efforts to develop Advanced Air Combat Concepts (A2C2) using DARPA technologies and to facilitate technology transition to the Services. Examples of these concepts include advanced fire control support for Air Force and Navy fighters as well as air directed surface-to-air missile (ADSAM) operations of Army and Navy systems. Analysis and modeling efforts will be performed to develop and refine employment architectures and concepts

BA 3 Advanced Technology Development			

of operations (CONOPS) utilizing DARPA technologies. Primary vehicles for these efforts will be in-house analysis, contracted studies, support for the Joint Staff (J-8) led Joint Cruise Missile Defense (JCMD) Study, and seminar wargames used to create and assess robust warfighting concepts supported by DARPA technologies. Selected portions of warfighting concepts will be demonstrated using these tools to validate key capabilities of DARPA technologies. Field demonstration scenarios will be derived from the analysis and modeling effort, combined with simulated exercises to facilitate operator involvement early in the process. CMD study plans call for DARPA to be a node on the Distributed Interactive Simulation (DIS) network with multiple Service Modeling and Simulation activities. Simulated exercises will concentrate on distributed interactive simulation (DIS) in addressing CONOPS and BM/C4I issues, while field demonstrations will highlight sensor operational effectiveness and treat transition-related factors in more depth.

(U) The Novel Antennas program will couple photonics, antennas and adaptive array processing experience with digital receiver and superconductivity to produce a small, light-weight, low-power system capable of locating specific emitters in a dense interference environment.

(U) The Low Cost Cruise Missile Defense (LCCMD): Program will employ emerging weapon system technologies to provide a cost effective approach to defeat a proliferated cruise missile threat. Weapon system options will be investigated, focusing on the development of a very low cost interceptor which could be deployed in large numbers.

(U) The emerging threat of cruise missiles imposes significant burdens on existing air defense sensors and systems. The current cruise missile defense effort is developing sensors which address engaging and destroying this difficult-to-detect, low flying threat which may be armed with weapons of mass destruction. Because of the potential payload, it is very desirable to be able to destroy the threat at long ranges (near its launch point). The use of airborne sensors will allow multiple ground-based missiles such as Patriot to engage the cruise missiles at ranges which are over the horizon to the Patriot ground-based radar. This concept is called ADSAM (Air Directed Surface to Air Missile). The purpose of this program is to demonstrate the architecture required for such remote engagements. It will build on the concepts explored in the DARPA Mountain Top with the Navy, which was completed in 1997 with the transition of the RSTER radar to the Navy under an MOU, and demonstrate the application of ADSAM to Army missiles. Patriot missiles will be modified under Army funding to permit successful engagement of low flying cruise missiles.

Sensor & Guidance Technology,
PE 0603762E, Project SGT-03

(U) FY 1997 Program:

- Novel Antennas: During FY 1997 DARPA will work closely with customers to complete the operational and system requirements study for the demonstration system. Risk reduction will occur on the antennas, photonics, and adaptive algorithms. Concept definition will be completed and initial subsystem capability demonstrated. (\$6M)
- Mountain Top Program: This program will finalize the Memorandum of Agreement between DARPA and the Navy and effect transfer of custody of the RSTER asset to the E-2C Program Office, PMA-231. (\$5.0M)
- Simulation: This program will focus on the development planning for an F-16 Silent Fighter Demonstration, an demonstration of advanced sensor support for fighters, an Advanced Combat ID demonstration, and a Joint Strike Fighter (JSF) Architecture study. (\$6.6M)
- Advanced Signal Processing: This program will employ the virtual STAP Algorithm Development Support Environment at MHPCC to design and develop advanced STAP algorithms for future AEW radar. The program will be completed in FY 1997 with the simulation testing of fieldable radar processing STAP algorithms. (\$8.8M)

(U) FY 1998 Program:

- LCCMD: The concept development efforts will be completed and a design effort will commence with the most promising concepts. All, part, or none of each of the concepts studied in the previous phase may be carried forth. (\$8.8M)
- SAR(E)CCM: A study panel will complete their effort and algorithm/hardware implementation will commence. (\$3.3M)
- ADSAM: The funds in this project will be used to provide cruise missile type targets, data links, test facilities, and the instrumentation required to evaluate the ADSAM architecture. Two series of tests, the first evaluating data link interfaces and checking out the instrumentation system, and the second evaluating the capabilities of the ADSAM architecture will be conducted. (\$6.0M)

(U) FY 1999 Program:

- LCCMD: The design efforts begun in FY 1998 will be completed. Fabrication of test articles for the FY 2001 demonstration(s) will begin. The number of demonstrations will be determined by the number of design study contracts awarded in FY 1998. (\$19.0M)
- SAR ECCM: Implementation of SAR ECCM algorithms and hardware will commence. Design efforts and test planning will get underway in preparation for a proof of principle demonstration scheduled for FY 2000. (\$7.0M)

* The FY 1996 program was previously budgeted in the Experimental Evaluation of Major Innovative Technologies, PE 0603226E (Project EE-40).

(U) **Mission Description:** The development efforts described herein embody key sensor demonstrations and the exploitation of sensor products. These efforts, in conjunction with those described in Project CCC-02 (Information Integration Systems) seek to develop the systems needed to provide the warrior with situational awareness and battlefield dominance. The strategic goals of this project are to: develop key sensor technologies required to support dominant battlefield awareness including sensors which can counter Camouflage, Concealment and Deception (CC&D); provide near-real-time, semi-automatic, exploitation of wide-area moderate (and high) resolution imagery; and provide semi-automated recognition and birth-to-death tracking of high value units and critical moving targets. These goals are being addressed by the Counter CC&D Program, the Semi-Automated Imagery Intelligence (IMINT) Processing (SAIP) Advanced Concept Technology Demonstration (ACTD), Moving and Stationary Target Acquisition and Recognition (MSTAR), Moving Target Exploitation (MTE), and Automatic Target Recognition (ATR) applications programs.

(U) The goal of the Counter CC&D Program is to provide significant enhancement of the military's capability to detect obscured targets hidden under natural and artificial camouflage. Specific goals include validation of Foliage Penetration (FOPEN) target detection capability (0.1 FA/sq.km max) with data from the P-3 Ultra-Wideband UHF Synthetic Aperture Radar (SAR) testbed and the DARPA-sponsored Swedish Carabas I Very High Frequency (VHF) SAR tests; and demonstrations of real-time processing of FOPEN high resolution SAR image formation, Radio-Frequency Interference (RFI) suppression and Automatic Target Detection/Classification (ATD/C) algorithms. A FOPEN Airborne Demonstration Radar will be developed for demonstration on a manned platform providing inputs via narrowband tactical data links for ground image exploitation. The image exploitation processing of SAIP will be extended for FOPEN as well as Multi/Hyper Spectral Image (M/HSI) sensor input, geolocation and sensor fusion processing of images, and detection of time critical targets. The program will ultimately combine FOPEN Radar on an Endurance Unmanned Aerial Vehicle (UAV) with other airborne sensors (e.g., the Senior Year Electro-Optical Reconnaissance System on the U-2, and develop combined exploitation technologies for insertion into the DARO Common Imagery Ground/Surface System (CIGSS).

BA 3 Advanced Technology Development			

(U) The Semi-Automated IMINT Processing (SAIP) ACTD will develop, test and transition to the operational user, automated algorithms and semi-automated tools that enhance the warfighter's capability to: process SAR, and later EO imagery; conduct wide-area search for Ground Order of Battle and Missile Order of Battle targets; perform rapid site modeling and site monitoring; and produce target reports in near real-time (< five minutes). Goals for the baseline system are: automatic target cueing and classification for a limited set of vehicles (10 targets); object level change detection; force recognition to the company level; and interactive target recognition and terrain delimitation. Goals for an enhanced system are: Increasing the automatic target cueing and classification to 20 targets; site modeling and monitoring with EO; and addition of SIGINT cueing. Goals for an enhanced fielded system are to increase automatic target recognition to 30 targets.

(U) The goal of the Moving and Stationary Target Acquisition and Recognition (MSTAR) program is to achieve a major advance in SAR Automatic Target Recognition (ATR) performance through fundamental and innovative technology developments and to transition this technology to fielded systems with ATR requirements. Other program goals include: Significant advances in interactive image exploitation environments and performance; development of rapid target model construction and rapid ATR updating methods; development of resource management systems for surveillance and exploitation, and development and demonstration of ATR and compression-based techniques to reduce communication bandwidths for SAR-based wide area search platforms to SATCOM-supportable bandwidths. Two approaches are being investigated and evaluated: A single scale approach that combines existing SAR image formation processing with detection and compression algorithms; and a multi-scale approach that embeds detection within the image formation processing to greatly reduce implementation complexity. Specific applications are targeted for the U-2 AIP and Global Hawk platforms although other reconnaissance and surveillance platforms that disseminate SAR imagery could also benefit from Intelligent Bandwidth Compression (IBC) technology.

(U) The goal of the Moving Target Exploitation (MTE) program is to achieve a major advance in computer-assisted moving target identification by providing previously unavailable capabilities to automatically detect, track, and classify high-valued ground-moving targets using all-weather airborne surveillance radar data. Four techniques are being investigated and evaluated: the automatic tracking of ground moving vehicles; the automatic analysis of moving vehicle motion patterns and behavior patterns to identify purposeful military movement; the discrimination of desired targets from other moving vehicles using high range resolution (HRR) moving target indication (MTI) range profiling and 1-D automatic target recognition (ATR); and the imaging of specific moving targets via enhanced moving target imaging (MTIm) processing and using 2-D ATR. Specific applications are targeted for the Joint STARS, U-2, and Global Hawk platforms.

PE 0603762E, Project SGT-04

(U) The goal of the Congressionally-mandated Geographic Synthetic Aperture Radar (GeosAR) Program is to develop and test an airborne, radar-based foliage penetration/terrain feature mapping and geographic information system with an emphasis on both defense and civil applications. The GeosAR system will be comprised of a P-Band FOPEN/IFSAR for mapping beneath the tree canopy and an X-Band IFSAR open terrain mapping system, combined with an efficient Geographic Information System (GIS) ground processor.

(U) The goal of the Low-Cost Hypersonic Interceptor (LCHI) program is to cooperatively employ US and Russian expertise and low-cost approaches to develop and demonstrate a low-cost, ground-launched, hypersonic interceptor airframe. The airframe will be designed with an agreed-upon payload section interface, allowing potential users to employ their own application-specific warhead and guidance and control subsystems. The program will develop a cooperative agreement with Russia.

(U) Program Accomplishments and Plans:(U) FY 1996 Accomplishments: N/A(U) FY 1997 Program:

- Complete Foliage Penetration (FOPEN) Concept Development and verify the System Requirements for a FOPEN Airborne Demonstrator radar targeted for a Medium or High Altitude Endurance (MAE/HAE) Unmanned Aerial Vehicle. Complete critical technology demonstration of ultra-wideband antenna design, airborne real-time processing interface, radio-frequency interference suppression, and FOPEN automatic target detection/classification. Develop and prototype Image Exploitation algorithms for FOPEN and EO (MSI) sensors within the SAIP exploitation architecture. Develop a test and evaluation plan with measurement criteria, validation approach and risk assessment matrix by critical technologies to integrate with the DUSD(AT) proposed Counter CC&D ACTD. (\$14.6M)
- Transition of component modules into the SAIP ACTD will be completed and integration continued to achieve enhanced system objectives in continued collaboration with the Defense Airborne Reconnaissance Office (DARO). The site modeling and monitoring component will be integrated, additional Missile Order of Battle and Ground Order of Battle models and algorithms inserted, and the system ported to a High Performance Computer architecture. Tests will be done on system performance with ETRAC and national imagery. (\$25.9M)
- The MSTAR 10 target recognition system with limited extended operating condition (EOC) capability will be integrated and evaluated, then matured into a 15 target system with increased EOC capability. Transition to SAIP ACTD of MSTAR modules will occur. Concepts and prototypes for interactive exploitation, rapid target

<p>insertion and rapid ATR updating will be developed and evaluated. The FY 1997 Intelligent Bandwidth Compression (IBC) program will evaluate a single scale ATR-based bandwidth compression system in a laboratory environment and will demonstrate its operation in a laboratory configuration of mobile stretch (MOBSTR) and also with the SAIP SAR exploitation system. A multi-scale IBC architecture will be developed and demonstrated in a laboratory environment. Both single and multiple scale approaches will be evaluated for real-time hardware and software integration onto the U2-AIP and Global Hawk platforms. (\$15.4M)</p> <ul style="list-style-type: none"> The FY 1997 Moving Target Exploitation (MTE) program will complete the integration and evaluation of MTE target classification technology components in a ground-based component testbed; non-real-time moving target classification (HRR, MTIm, 1-D and 2-D ATR techniques) using recorded data will be demonstrated. Vehicle motion pattern analysis and behavior pattern analysis (MPA/BPA) techniques will be investigated and developed to identify purposeful military movement in MTI data. A simulation test bed will be developed to investigate, evaluate, and demonstrate enhanced ground tracking capabilities and preliminary techniques for MPA/BPA using scalable scenarios. The MTE program, in coordination with USAF ESC/JS, will record MTE data using the Joint Surveillance, Target, and Attack Radar System (Joint STARS) in FY 1997 and this data will be processed in the ground-based testbed. System analysis and trade studies will be conducted to an architecture to transition MTE technologies to the U-2 AIP and Global Hawk platforms. (\$6.0M) Complete ground test demonstration of the GeosAR P-Band radar, system integration in test aircraft, and critical design review of P-Band and X-Band radar. (\$12.7M) 		

(U) FY 1998 Program:

- The counter CC&D Program will develop a Foliage Penetration (FOPEN) Airborne Demonstrator radar for test and evaluation on a manned platform, providing inputs via narrowband tactical data links to the image exploitation capabilities in SAIP ground processing facility. The Image Exploitation techniques developed under SAIP will be extended to include unique characteristics of VHF/UHF band FOPEN radar, high spatial resolution U2 SYERS MSI sensor, and high spectral resolution Predator HSI sensor, and multisensor correlation to improve the reliability of detection and discrimination of tactical targets under camouflage and foliage cover. (\$24.0M)
- Semi-Automated IMINT Processing (SAIP) integration and field testing will continue to achieve transition system objectives and to support U-2 ASARS-2, and the ASARS Improvement Program. Transition to the operational customer, U.S. Atlantic Command, will begin. (\$24.4M)
- The MSTAR 15 target recognition system with increased EOC capability will be integrated and evaluated, then matured into a 20 target system with greater EOC capability. The system then will be fully characterized vs. the defined target set and full EOC dimensions. Transition of the MSTAR system to SAIP and Counter CC&D

ACTDs will occur. Full prototypes for interactive exploitation for two analyst missions will be developed and evaluated. A rapid target insertion prototype system will be built and evaluated, creating 5 target models and rapid ATR training systems as a baseline. A resource management prototype will be built and evaluated. The IBC program will combine the best performance components of the single scale and multiple-scale approaches and develop an integrated, real-time demonstrations for the U2-AIP or Global Hawk platform and in support of SAIP exploitation system split-based operation. Airborne and field demonstrations are planned. (\$18.9M)

- The MTE program will demonstrate, near-real-time operational MTE performance against high-value moving targets by integrating the classification component and simulation testbeds developed in FY 1997 into a single MTE system testbed. This testbed will be exercised with recorded Joint STARS data. In parallel, more extensive MPA/BPA tools will be investigated, developed, and exercised and evaluated in the simulation testbed. The simulation testbed will be expanded to emulate the MTE data that will be available from the U2-AIP and Global Hawk platforms. The moving target classification (HRR, MTIm, 1-D and 2-D ATR) techniques will be evaluated and demonstrated for U2-AIP and Global Hawk sensor parameters. A coordinated Joint STARS and U-2/Global Hawk platforms will be conducted providing instrumented multiple platform MTI data. (\$14.3M)
- The Low-Cost Hypersonic Interceptor (LCHI) program will establish the US and Russia teams, initiate joint concept development and requirements definition for the demonstration guidance and control section of the interceptor, and begin further definition and execution of critical experiments. (\$1.0M)

(U) FY 1999 Program:

- The counter CC&D Program will complete Airborne Demonstrator Flight Test and Evaluation on manned platform in conjunction with SAIP ground exploitation capabilities during tactically significant military exercises to verify performance capabilities of ATD/C of tactical targets in CC&D. Initiate integration of FOPEN and Hyperspectral sensors into a Medium or High altitude/endurance (HAE) UAV depending on suitability of sensor and UAV CONOPS. (\$25.0M)
- The ACOM Operational Assessment, with final transition configuration of system stood up, will be performed and demonstration of all software upgrades and transition will be conducted. (\$9.5M)
- The evaluation of the MSTAR 20 target/full EOC system will be completed, system technology will be transferred to the SAIP and STARLOS programs, and a two year effort to develop a high performance computing adaptation for an MSTAR real time demonstration system will begin. Development and evaluation of resource management, rapid target insertion, rapid ATR updating and interactive exploitation systems will continue, with key milestones occurring in FY 2000. (\$22.5M)

Nov 97 Second major demonstration of MSTAR ATR: 15 targets with increased EOCs. Transition modules to SAIP.

Jan 98 Laboratory Demo of FOPEN and HSI/MSI Image Exploitation on SAIP Architecture processors.

Jan 98 Airborne demo of data compression/screening capability on U-2R.

Jun 98 Operational demo of MTE system on JSTARS.

Jun 98 Real-time operational MTE demonstration with Joint STARS.

Jun 98 LCHI procurement and joint US/Russian team finalized.

Aug 98 Demonstrate required MTE performance in U-2 virtual testbed.

Nov 98 Start Integration of FOPEN Airborne Demonstration Radar.

Nov 98 Final MSTAR ATR demo: 20 targets, full range of EOCs; transition system to SAIP.

Nov 98 Joint operational demonstration with Joint STARS.

Jan 99 Ground demonstration of Image Exploitation of SYERS MSI and Predator HIS images.

Feb 99 Operational demonstration of MTE with the U-2.

Apr 99 Operational demonstration of MTE with an HAE.

Jun 99 Flight demonstration of FOPEN Radar with CIGSS Image Exploitation System.

Jun 99 Concept and requirements for LCHI demonstration interceptor finalized.

Jun 99 LCHI critical experiments for interceptor redesign complete.

Jul 99 Complete integration of SAIP transition configuration.

Sep 99 HAE demonstration (MTE).

(U) **Mission Description:** The Marine Technology program element is budgeted in the Advanced Technology Development Budget Activity because it is developing and applying the technologies necessary to ensure U.S. maritime superiority. Two projects are funded under this program element: The Arsenal Ship; and Advanced Ship/Sensor Systems.

(U) The Arsenal Ship effort is leveraging DARPA technological advances in ship systems automation, surveillance, fire control and low observability, and employing acquisition streamlining techniques to develop an affordable and effective surface ship to provide land-based or littoral warfare support. A joint Navy/DARPA program, the Arsenal Ship will have approximately 500 Vertical Launch System cells, will require a very small crew (and possibly be unmanned), and incorporate survivability features in its basic design. The joint program will culminate in the construction of an Arsenal Ship demonstrator vessel.

(U) The Advanced Ship/Sensors Systems project is developing the systems and components necessary to engage and counter increasingly sophisticated submarine and underwater mine threats. Programs under development include sensor and sonar technologies, advanced ship mechanical systems, and advanced maritime platforms.

Marine Technology, PE 0603763E

COST (In Thousands)	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	Cost to Complete	Total Cost
Arsenal Ship MRN-01	0	19,577	47,200	50,000	36,000	22,000	0	0	0	N/A

(U) **Mission Description:** In the Arsenal Ship project, DARPA will identify and develop high leverage technologies and acquisition improvements to support future surface ships with an emphasis on littoral missions. The objectives of this new project have far-reaching implications for the future of surface ships for the US Navy. The project is currently structured in two parts:

(U) Arsenal Ship is a high priority joint Navy/DARPA program to acquire a new capability for delivery of large quantities of ordnance (approximately 500 Vertical Launch System (VLS) cells) in support of land and littoral engagements. Key to both arsenal ship's affordability and operational flexibility is off-board integration of all but the most rudimentary C4I. The ships are to be theater assets that will operate under the authority of the joint Commanders-In-Chief (CINCS) and will receive their targeting along with command and decision information from other assets. Early in arsenal ship's life this control will be exercised through an Aegis platform, though as other assets mature, control will transition to aircraft such as AWACS or an E-2 with Cooperative Engagement Capability (CEC) and eventually to the Marine or Army shooter on the ground. Thus, the Arsenal Ship will not be fitted with long range surveillance or fire control sensors, but will be remotely controlled via robust data links. The data links will be secure, redundant and anti-jam in order to provide high reliability in the connectivity of the Arsenal Ships in high jamming operational scenarios. The overall program is an attempt to leverage the significant joint investment in Link 16 and CEC. The Arsenal Ship's survivability will be primarily achieved through passive design techniques. While active systems are not ruled out, they must be consistent with overall cost and manning goals. These design goals will allow the Arsenal Ship to have a very small crew (potentially, none at all) which will be a key ingredient in minimizing its life cycle costs.

(U) This demonstration program is a non-ACAT (Acquisition Category) program to design, construct, and test one arsenal ship demonstrator (ASD) to evaluate this new capability while minimizing the risks in acquisition of approximately six ships (to include conversion of the arsenal ship demonstrator to a fleet operational unit).

(U) As a result of studies that DARPA has performed, it is very clear that we should expect significant re-trenching from overseas deployments by US forces. This, coupled with the growing unaffordability of maritime pre-positioned logistics, will require that future forces be deployable from CONUS. The large travel distances suggest

* The FY 1996 program was previously budgeted in the Experimental Evaluation of Major Innovative Technologies PE 0603226E.

(U) **Mission Description:** The objectives of this project are to develop and demonstrate advanced systems concepts and to pursue critical enabling technologies for maritime systems that will counter the threat created by the worldwide spread of increasingly sophisticated military technology. The evolving threat of quiet diesel/electric submarines, the proliferation of sophisticated submarine and weapons capabilities, and the growing stockpile of underwater mines available to third world countries necessitates the development of far-term solutions for increased ship affordability and enhancing our operating capabilities in the littoral. This project will provide advanced technologies to enhance the capabilities of naval forces to more effectively operate "...forward from the sea" in a broader range of tactical environments.

(U) The Advanced Ship-Sensor Systems Program includes sensor and sonar technology, and advanced ship mechanical systems, and advanced maritime platforms. In the Sonar Technology area, applications of advanced object detection, classification, and localization technologies using High Performance Computing (HPC) are demonstrated. Active and passive sonar techniques are applied, using advanced sources and sonar systems built from distributed elements or concentrated arrays. Advanced signal processing techniques to integrate real-time information and background intelligence into the operational situation are included. These applications will result in enhanced Anti-Submarine Warfare (ASW) capability against diesel-electric submarines operating in shallow water.

(U) In the Advanced Ship Mechanical Systems area, technologies such as active structural controls, actuator and sensor systems and high speed digital signal processing are being developed. These technologies will result in reduced ship acoustic signatures, high performance/high reliability propulsion systems, a safer/more survivable ship, and increased ship system affordability.

(U) Advanced maritime platform efforts include technologies for innovative ships and ship systems to provide the multi-mission, sustained presence capability required for joint operations associated with future regional conflicts. The advanced ASW program addresses coordinated source and receiver concepts to substantially increase the range for reliable detection and classification of quiet submarines. A particular focus is waveform design for optimal noise rejection and enhancement of target echoes.

(U) The Water Hammer program will design, fabricate, and demonstrate a mine neutralization system consisting of a phased array of shock tubes to generate, focus, and transport to militarily important distances (tens of meters) a pressure pulse of sufficient energy to neutralize the threat (≥ 1000 psi-msec; ≥ 2000 psi). Water Hammer has the potential for rapid, precision, in-stride lane clearance in deep or shallow water, reducing the need for high fidelity detection and classification. While the initial program focuses on mine/obstacle clearance, Water Hammer also has utility as a close-in defense system for ships against underwater threats. Current close-in defense systems are primarily surface based and address surface threats. Water Hammer can potentially provide rapid targeting and destruction of subsurface threats.

(U) **Program Accomplishments and Plans:**

(U) **FY 1996 Accomplishments:** N/A

(U) **FY 1997 Program:**

- Complete final at-sea ASW demonstration of environmentally adaptive shallow water active sonar technology in conjunction with single/few platform scene generation capability. (\$1.1M)
- Conduct tests to determine the effectiveness of supercavitating high speed bodies against fixed targets. (\$0.8M)
- Complete development of autonomous ASW multi-target detection technology. (\$0.8M)
- Fabricate and integrate a prototype active transmission vibration isolation mount. (\$3.0M)
- Continue experimental program for EMTC technology to address electrode/magnet design, controller design, system optimization and power scaling issues. (\$2.0M)
- Initiate development of the Netted Search, Acquisition and Targeting (NSAT) for littoral surveillance to include an acoustic source, as well as signal processing for enhanced detection and attack performance. (\$4.0M)
- Design and initiate the fabrication of a prototype acoustic mine detection and classification system for a large (10 sqnm/hr) area coverage rate. (\$1.6M)
- Develop space-time adaptive processing techniques and perform ocean tests to enhance long range active coherence and towed array detection performance. (\$2.2M)
- The following Shallow Water ASW efforts were funded by Congressional additions to the FY 1997 President's Budget:

- Extend autonomous ASW detection and classification effort to multiple targets and broader application to fleet systems. Deploy and evaluate autonomous submarine detection and classification processor in operational environment. (\$2.8M)
- Develop advanced signal detection and processing algorithms to mitigate effects of torpedo acoustic countermeasures. (\$1.2M)
- Design and develop a high-resolution synthetic aperture sonar towed-array system for mine detection and classification from high speed platforms. (\$1.9M)

(U) FY 1998 Program:

- Continue development, plan, and test proof-of-concept Anti-Submarine Warfare (ASW) Netted Search, Acquisition and Targeting (NSAT) system at sea, incorporating a wide frequency band, autonomous, long duration, leave behind acoustic source; signal processing for enhanced detection and attack performance; and acoustic space-time adaptive processing. (\$7.5M)
- Complete fabrication and conduct at-sea testing of a prototype acoustic mine detection and classification system for a large (10 sqnm/hr) area coverage rate. (\$3.5M)
- Initiate development of a system for signal exploitation and environmentally adaptive waveform generation. (\$6.0M)
- Develop advanced submarine hydrodynamics and structural designs that are focused toward reducing submarine target strength against active sensor detection. (\$5M)
- Initiate development of non-explosive underwater energy projection technology. (\$2.0M)
- Commence design work for an at-sea demonstration of Electromagnetic Turbulence Control (EMTC) or other flow enhancements, exploiting potential drag reduction technologies leading to an improved flowfield for a submarine. (\$2.4M)

(U) FY 1999 Program:

- Upgrade system and demonstrate detection-to-attack performance of a prototype ASW NSAT system, incorporating: full wide frequency band, autonomous, long duration, leave behind acoustic source, autonomous diesel electric detection; signal processing for enhanced attack performance; and acoustic space-time adaptive processing. (\$12.1M)
- Upgrade system and conduct an at-sea demonstration test of a prototype acoustic mine detection and classification system for a large (10 sqnm/hr) area coverage rate. (\$6.2M)
- Continue development of and conduct at-sea testing of a signal exploitation and environmentally adaptive waveform generation system. (\$7.7M)

(U) **Mission Description:** This program element is budgeted in the Advanced Technology Development Budget Activity because it is developing and demonstrating the concepts and technologies that will address the mission requirements of the 21st Century land warrior. Two broad efforts are being pursued in support of this objective: Rapid Strike Force Technology and Small Unit Operations.

(U) The Rapid Strike Force Technology project is developing the technologies necessary for highly mobile, covert transportation and information gathering systems to enhance U.S. early-entry capabilities. The primary thrusts of this project are the Combat Hybrid Power Systems program that is developing and demonstrating hybrid electric power and energy management systems for cavalry/scout vehicles; the Reconnaissance, Surveillance, and Targeting (RST) vehicle program that is designing, developing and testing components and subsystems for a future lightweight, highly maneuverable manned or unmanned vehicle; and the Covert Subterranean Probe program that will enable accurate characterization of Deep Underground Facilities. Congressional fuel cell and helicopter active structural control initiatives are also funded in this project.

(U) The Small Unit Operations project is developing the critical technologies that will enable dispersed units to effectively perform warfighting operations that traditionally have required massed forces. Tactical level battlefield awareness, wireless communications, geolocation technologies for navigation in various terrains, internettted sensors, and automated tasking and control systems are but a few of the technologies being pursued in this project.

COST (In Millions)	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	Cost to Complete	Total Cost
Rapid Strike Force Technology LNW-01	0*	19,920	29,000	38,500	18,000	17,000	24,000	20,000	Continuing	Continuing

* In FY 1996, the Integrated Product and Process Development Program (Project EE-37, PE 0603226E) developed concurrent engineering/virtual prototyping technology that will be used in the conceptual design and analysis of the Combat Hybrid Power System.

(U) **Mission Description:** The emerging U.S. vision of future land warfare places strong emphasis on technology supporting early entry. This project is developing technologies that enable highly-mobile, covert transportation and information gathering systems, which are important aspects of an early-entry capability. The project consists of six primary efforts: Combat Hybrid Power Systems (CHPS); Molten Carbonate Fuel Cells; Helicopter Active Noise and Vibration Control (HANVC); Reconnaissance, Surveillance, and Targeting (RST) Vehicle; Covert Subterranean Probe; and Thermophotovoltaics (TPV). The CHPS and RST Vehicle programs are closely coordinated with the U.S. Army, Navy, Marine Corps, DARPA's Electric Vehicle Program (EV-01), and DARPA's Small Unit Operations Program (LNW-02).

(U) The Combat Hybrid Power System program will develop enabling technologies and conduct demonstrations of an integrated hybrid electric power system that provides power and energy management for all of the subsystems throughout the cavalry/scout vehicle and is scaleable to combat systems. The hybrid electric power system will consist of an engine/alternator, sized for average power demand, energy storage and power averaging components which provide both continuous and pulsed power, distribution networks, subsystem controls, and power conditioning devices. Vehicles will be simulated to evaluate subsystem requirements, topologies, and military utility. Hybrid electric power is an enabling technology for future combat vehicles if electrically powered subsystems are to be implemented. The vehicles will have greatly reduced noise and thermal signatures; and improved mobility, survivability, lethality, and fuel economy. By eliminating rigid connections between components, interior layout can be optimized, significantly reducing volumetric constraints. These advantages will result in deployable, affordable combat vehicles that meet mission requirements.

(U) The Carbonate Based Fuel Cells program will develop military enhancements to the Department of Energy's Direct Molten Carbonate Fuel Cell (MCFC) program. The enhancements will assist in more rapid introduction of the MCFC power plants for stationary power applications for military bases by adding dual-fuel (natural gas and logistic fuel) and simulator capabilities. The MCFC power systems will provide a reliable and robust power for operations at overseas military sites using logistics fuel where natural gas may not be readily available.

APPROPRIATION/BUDGET ACTIVITY RDT&E, Defensewide BA 3 Advanced Technology Development		R-1 ITEM NOMENCLATURE Land Warfare Technology PE 0603764E, Project LNW-01	
<p>(U) The Helicopter Active Noise and Vibration Control (HANVC) program will design, fabricate and demonstrate an Active Rotor Control (ARC) system that should achieve 10dB radiated sound pressure noise reduction. This technology should significantly improve helicopter survivability by minimizing detection by helicopter mines and reducing alert time for shoulder launched missile crewmen. In addition, a system that actively cancels vibrations and noise from the main transmission will be demonstrated; this system has the potential for significantly reducing maintenance costs as well as crew and passenger discomfort.</p> <p>(U) The Reconnaissance, Surveillance, and Targeting (RST) Vehicle program will design, develop, test, and transition to the Services critical components and technology for a lightweight, highly maneuverable vehicle. The vehicle will host integrated precision geolocation, communication and RST sensor subsystems provided by DARPA's Small Unit Operations Program. The RST vehicle will provide the essential mobility component of the DARPA, U.S. Army, and Marine Corps small unit operations concepts. Critical components and technologies include a high efficiency, reduced signature hybrid electric power system; an electric propulsion system; a semi-active electromechanical suspension to double cross-country speed and provide platform stabilization; an advanced survivability suite; and the capability to operate as either a manned or unmanned platform. The Marine Corps will develop vehicle concepts and chassis, integrate the DARPA developed components, and conduct vehicle performance tests (PE 0603640M). Additional co-funding for semi-autonomous capability will be provided by the Office of Secretary of Defense Joint Robotics Program (PE 0603709D).</p> <p>(U) The Covert Subterranean Probe (CSP) Program will develop and demonstrate advanced technologies for the accurate characterization of Deep Underground Facilities (DUF) for precision strike or counterproliferation. CSP research will include: (1) Technologies for miniature (cm size) probes that can be introduced into known or suspected subterranean facilities to collect and record information about the facilities such as trace elements for indication of chemical, biological or nuclear weapons or materials; (2) Technologies to store and forward recorded information obtained by the covert probes and sensors, augmented by inertial navigation sensors to accurately trace the movement of sensor platforms; (3) Bistatic, remote sensing, and other technologies (electromagnetic and acoustic) for localizing and characterizing subterranean structures and the surrounding environment.</p> <p>(U) The Thermophotovoltaics (TPV) program will develop and demonstrate thermophotovoltaic (TPV) technology and systems. TPV is expected to be the most efficient way to convert logistic fuel into electricity at power levels below 5 kW. TPV systems will be quiet, clean and reliable with low NOx (<10ppm) emissions and few moving parts. A TPV system will supply better energy density than batteries for military portable and mobile power supply systems. The Services, especially the Army and Special Operations, face increasing demand for more energetic power sources for</p>

Aug 97 Establish subsystem requirements, set component specifications, and support hybrid electric powersystem technology development using integrated, hybrid electric powered combat vehicle virtual prototypes.

Jan 98 Downselect components for final combat hybrid power system demonstration.

Mar 98 Complete Mission and Threat Analysis for Covert Subterranean Probe (CSP).

Apr 98 Complete a field demonstration of a portable Thermophotovoltaics (TPV) system.

May 98 Complete Mach-scale fabrication for Helicopter Active Noise and Vibration Control (HANVC) program.

Jun 98 Complete combat hybrid power system integration and test plan.

Aug 98 Complete wind tunnel tests of the Mach-scale active rotor system.

Sep 98 Test Reconnaissance, Surveillance, and Targeting (RST) vehicle critical components and conduct critical design review.

Sep 98 Complete design review of enabling technologies for CSP.

Oct 98 Complete simulators and procedures for dual-fuel MCFC power plant.

Jun 99 Demonstrate hardware in the loop virtual prototype of combat hybrid power system.

Sep 99 Demonstrate RST vehicle subsystems.

Dec 99 Initiate Probe Development.

Dec 99 Complete Covert Subterranean Probe (CSP) preliminary designs.

Mar 00 Integrate and demonstrate advanced components into combat hybrid power system laboratory demonstration.

Sep 00 Assemble subsystems and integrate into Marine Corps RST vehicle chassis.

Mar 01 Demonstrate 5-ton RST vehicle system capabilities.

* The FY 1996 program was previously budgeted in the Experimental Evaluation of Major Innovative Technologies PE 0603226E. Related FY 1996 effort performed in PE 0602301E, project ST-11 (\$3.5M) and PE 0602702E, project TT-04 (\$10.8M).

(U) **Mission Description:** The objectives of this program are to develop critical technologies which enable dispersed units to effectively perform warfighting operations traditionally accomplished with massed forces. With declining resources and a smaller military, the Services must be prepared to quickly project sufficient power to achieve United States objectives rapidly and effectively. Due to the reduced forward presence of US forces, future deployment of our forces will be restricted by airlift assets and in-theater infrastructure; and they will operate under more complex rules of engagement. Adversaries who are not very powerful may possess sophisticated technology that will place our forces at risk. These risks are increased if our forces are massed to conduct traditional conventional operations. To fight effectively in the future, the Army and Marine Corps are developing concepts of operation (Army - Force XXI and Marine Corps - Sea Dragon) whose tactical implementation will vary, but with similarities that include lighter, more lethal, more flexible forces that are widely dispersed throughout the battlefield. The objective is to enable these forces to quickly control a large battlespace with dispersed forces, control the operational tempo, engage enemy targets with remote fire, and operate effectively across the spectrum of conflict and in a variety of environments.

(U) The keys to success for these units are a vastly improved and highly integrated comprehensive awareness system, robust communications, and an integrated, scaleable common grid of the battlespace. While there are many technology developments underway that will assist the Services to accomplish their objectives, at the tactical level there are technology gaps that DARPA will help narrow under the Small Unit Operations program. Technology development efforts will focus on a comprehensive awareness capability that provides real-time, essential information for small units and individual warfighters; wireless communication technologies to permit exchange of voice, digital and video data with other systems; geolocation technologies that provide navigation information in built-up, forested and mountain environments; internetted tactical surveillance and targeting sensors to complement information requirements not satisfied by national, theater, and component sensor programs; and automated tasking and control technologies for air and ground systems. As these technologies mature they will be tested and evaluated. Engineering demonstrations with combatant participation will be conducted to assess program progress in a realistic environment which provides

COST (In Thousands)	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	Cost to Complete	Total Cost
Joint Strike Fighter Program JA-01	28,917	72,865	23,900	0	0	0	0	0	0	N/A

(U) **Mission Description:** The Joint Strike Fighter (JSF) Program is the focal point for defining affordable next generation strike aircraft weapon systems for the USN, USMC, USAF, and allies. Program emphasis is on facilitating the evolution of fully validated and affordable joint operational requirements, and demonstrating cost leveraging technologies and concepts to lower risk prior to entering engineering and manufacturing development (E&MD) of the JSF in FY 2001. The JSF Program is a joint program with no executive Service. Since FY 1995, the Navy and Air Force have provided approximately equal shares of annual program funding. DARPA's Advanced Short Take Off Vertical Landing (ASTOVL)/Conventional Take Off and Landing (CTOL) Common Affordable Lightweight Fighter (CALF) project (previously known as ASTOVL) was integrated with the JSF program by FY 1995 legislation. DARPA contributed funding for the JSF program in FY 1996 under this new program element. The US/UK international collaborative CALF program conceived by DARPA was investigating a revolutionary approach for melding advanced technology, multi-service commonality, and improved business practices into the demonstration of an affordable, capable replacement for the F-16, F/A-18, and AV-8B. DARPA has brought this insight and experience to bear in integrating the structure and philosophy of the CALF program within the JSF framework. DARPA is now serving as the Director for Joint Advanced Strike Technologies within the JSF program organization. This ensures that DARPA's expertise in advanced weapon system technologies, streamlined acquisition, and rapid prototyping are brought to bear in the JSF technology demonstration program.

(U) **Program Accomplishments and Plans:**(U) **FY 1996 Accomplishments:**

- Completed critical technology validation of the Direct Lift and Shaft Coupled Lift Fan Concepts. (\$7.4M)
- Commenced Preliminary Demonstration Design Propulsion and JSF Competitive Engine efforts. (\$18.3M)
- Commenced concept definition and design research for weapon system concept for a tri-service family of aircraft. (\$3.2M)

(U) **FY 1997 Program:**

- Conduct ground demonstration of the concept demonstrator aircraft propulsion systems and technology maturation of the propulsion systems for the preferred weapon system concepts. (\$43.2M)

Dual Use Applications Program,
PE 0603805E, R-1 #62

COST (In Thousands)	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	FY 2003	Cost to Complete	Total Cost
Dual Use Applications Programs GC-01 / GC-02	0	181,184	225,000	225,000	225,000	225,000	225,000	225,000	Continuing	Continuing

(U) **Mission Description:** The mission of the Dual Use Applications Program (DUAP) is to prototype and demonstrate new approaches for leveraging commercial research, technology, products, and processes in military systems. In the long term, these new approaches to working with industry, many of which have been prototyped at DARPA, must become common throughout the DoD in order to take full advantage of the technological opportunities offered by the commercial sector. In particular, DUAP will enable the Services to leverage commercial R&D to improve the cost and performance of military systems, and to insert commercial products and processes into fielded systems to decrease operations and support (O&S) costs. Approximately \$98 million of the FY 1997 funding was appropriated as one year funding, and these funds have been budgeted in a separate project to facilitate accounting oversight. The FY 1998 and subsequent year funds are all budgeted in a single project (GC-01).

(U) A Dual Use Steering Group, composed of the Under Secretary of Defense (Acquisition and Technology) USD(A&T), the Service Acquisition Executives (SAEs), the Deputy Under Secretary of Defense for International and Commercial Programs, and Director Defense Research and Engineering (DDR&E), is overseeing DUAP, which is administered by the Joint Dual Use Program Office (JDUPO). This "Board of Directors" will see that the approaches developed under DUAP transition throughout the DoD.

(U) Success depends on intentional leveraging of the commercial sector's research, products, and processes for the benefit of the DoD. By its nature, this is an entrepreneurial activity that pushes the envelope of the rules, regulations, and procedures typical in traditional DoD activities. While acquisition reform has helped clear the path, and experience has shown dual use R&D is practical, it has also shown that leveraging approaches are unfamiliar to many and have not yet been widely adopted. DoD's current challenge is to proliferate the use of commercial sector leverage more deeply throughout the Military Departments and establish it as a normal way of doing business.

(U) Beginning in FY 1997 the DUAP will fund two initiatives to encourage leveraging in the military Services. Roughly half will be spent on a dual use Science and Technology (S&T) Initiative that will be largely carried out by each Service. The remaining DUAP funds will be spent on the Commercial O&S Savings Initiative (COSSI), which will prototype an approach the Services could adopt to routinely insert commercial products and processes into fielded systems to reduce O&S costs.

UNCLASSIFIED

RDT&E BUDGET ITEM JUSTIFICATION SHEET (R-2 Exhibit)		DATE	February 1997
APPROPRIATION/BUDGET ACTIVITY RDT&E, Defensewide BA 3 Advanced Technology Development		R-1 ITEM NOMENCLATURE Dual Use Applications Program, PE 0603805E, Projects GC-01/02	
<p>(U) Under both initiatives, proposals from industry will be identified and prioritized by the Services. In the S&T Initiative, each Service will generate its own BAA(s) and will evaluate, prioritize, and submit a list of projects for DUAP funding. Under COSSI, a BAA will be issued by JDUPO and the subsequent evaluation and prioritizations will be done by each Service individually. The JDUPO will review the Service submissions and make recommendations on proposal selection to the Steering Group. Under both initiatives, final selections will be made by the Steering Group based on available funds.</p> <p>(U) <u>Program Accomplishments and Plans:</u></p> <p>(U) <u>FY 1996 Accomplishments:</u> N/A</p> <p>(U) <u>FY 1997 Program:</u></p> <ul style="list-style-type: none"> • S&T Initiative: Each Service will generate a competitively selected, prioritized list of dual-use S&T projects for consideration by JDUPO -- i.e. projects to develop militarily useful, commercially viable technology. Each service will pick the technology areas they wish to emphasize. Included in the solicitation for each project will be a requirement for 50% cost sharing with industry. Additionally, each Service will be expected to contribute at least 25% of the total cost of each project; DUAP would provide the remaining 25%. The JDUPO will reconcile the recommendations of all three Services, and the Dual Use Steering Group will make the final selections. All projects will be awarded using either Cooperative Agreements or Other Transactions. This is essentially a "learning by doing" approach to dual use S&T in the Services, with DUAP funds providing an incentive and JDUPO providing advice across all the Services. (\$81.2M) • Commercial Operations and Support (O&S) Savings Initiative (COSSI): COSSI's mission is prototype an approach the Services could adopt to routinely insert commercial products and processes into fielded systems to reduce O&S costs by reducing the costs of parts and maintenance, reducing the need for specialized equipment, increasing reliability, and increasing the efficiency of subsystems. Selected proposers will develop, manufacture, and deliver prototype "kits" for installation into a fielded system. Each kit will consist of a commercial product or process that has been adapted, qualification-tested, and readied for insertion. Industry will work with Service program managers (i.e. the military customer) to develop their proposed technical approach and O&S savings analysis for the kits; proposals must include target prices for kits. In Stage I of each COSSI project, DUAP and the chosen proposer will share the costs of developing and testing the kit. In Stage II, provided Stage I has been successful, the military customer may purchase

- reasonable production quantities of the kits. It will be the goal to purchase the selected kits and, if applicable, maintenance agreements in Stage II:
- without recompetition,
 - at a fair and reasonable price based on an analysis of the value of the kits to the Service (for O&S savings), and
 - without requiring proposers to provide detailed cost and pricing data.
- To reduce the traditional administrative burden and oversight of government contracts and make COSSI more attractive to commercial firms, Stage I will be conducted using a section 845/804 prototyping agreement. (\$100.0M)

(U) FY 1998 Program:

- S&T Initiative: In FY 1998, JDUPO's administrative role will be reduced in this portion of the DUAP. It is planned that JDUPO will participate in the process largely as a facilitator and trainer for the Services, providing DUAP funds to give incentive to the Services, and as consultant to the Military departments as they develop and institutionalize their own dual use procedures. (\$100.0M)
- COSSI: In FY 1998 full responsibility for soliciting the COSSI projects will pass to the Services with the JDUPO filling a role similar to the one the played in the FY 1997 S&T initiative. (\$125.0M)

(U) FY 1999 Program:

- S&T Initiative: In FY 1999 JDUPO will transition this portion of the DUAP to the Services. JDUPO's role will be exclusively monitoring ongoing efforts and advising the Military Departments on their own dual use procedures. (\$100.0M)
- COSSI: JDUPO's role in FY 1999 will be one of advisor and facilitator as the Services establish their own version of the commercial insertion initiatives. (\$125.0M)

Management Headquarters MH-01	33,116	36,354	39,193	41,260	41,916	42,755	44,353	44,963	Continuing	Continuing	

(U) **Mission Description:** This program element is budgeted in the Management Support Budget Activity because it provides funding for the administrative support costs of the Defense Advanced Research Projects Agency. The funds provide for personnel compensation for civilians as well as costs for building rent, physical and information security, travel, supplies and equipment, communications, printing and reproduction. In addition, funds are included for reimbursing the Military Services for administrative support costs associated with contracts undertaken on the Agency's behalf.

(U) **Program Accomplishments and Plans:**

(U) **FY 1996 Accomplishments:**

- Funding under this program element in FY 1996 supported management and administration for the RDT&E programs assigned to DARPA. The majority of the funds were required for the pay of personnel who operate the Agency. The funding level reflects the rental costs associated with the expansion of office space, and the related support and security requirements.

(U) **FY 1997 Program:**

- DARPA will continue the management and administrative support efforts for headquarters at approximately the same level as FY 1996 as well as enhanced physical and information security requirements. Increases reflect annualization of increased support begun in FY 1996.

(U) **FY 1998 Program:**

- DARPA will continue the management and administrative support efforts for headquarters at approximately the same levels as FY 1997. The funding level reflects increased rent, pay raise requirements, and a legislative initiative to expand Intergovernmental Personnel Act appointments.

(U) **FY 1999 Program:**

- DARPA will continue the management and administrative support efforts for headquarters at approximately the same levels as FY 1998. The funding level reflects pay raise requirements.
